Contents

Chapter 1: What's new

New features summary	1
----------------------------	---

Chapter 2: Workspace

Workspace basics	3
Viewing stories	14
Recovery and undo	21
Moving through documents	23
Customizing preferences and defaults	25

Chapter 3: InCopy documents

Create and use InCopy workflows	27
Transforming graphics	28
Stand-alone documents	30
Saving and exporting	33
Importing graphics	36
Including metadata in a story	50
Controlling graphics display	52
Frame grids	55
Frames, grids, rulers, and guides	57

Chapter 4: InCopy and InDesign

Sharing content	65
Working with managed files	70
Understanding a basic managed-file workflow	75
Adjusting your workflow	82
Assignment packages	84

Chapter 5: Text

Glyphs and special characters	88
Using editorial notes	95
Using the thesaurus	99
Using text macros	101
Tracking and reviewing changes	103
Text variables	106
Hyperlinks	111
Adding text	117
Checking spelling	123
Cross-references	130
Copyfitting text	137
Editing text	139
Find/Change	149
Footnotes	166

Chapter 6: Styles

Paragraph and character styles 171
Working with styles 180
Drop caps and nested styles 181

Chapter 7: Typography

Bullets and numbering 189
Formatting CJK characters 199
Using fonts 204
Text composition 213
Tabs and indents 218
Leading 225
Kerning and tracking 228
Aligning text 231
Composing CJK characters 238
Changing spacing between characters in CJK text 252
Formatting characters 253
Formatting paragraphs 261
Formatting text 266

Chapter 8: Tables

Formatting tables 271
Selecting and editing tables 275
Table and cell styles 281
Table strokes and fills 287
Creating tables 290

Chapter 9: Printing

Setting up a printer 295
Printing stories 296

Chapter 10: PDF

Understanding Adobe PDF 299
Exporting to Adobe PDF 300

Chapter 11: XML

Working with XML 304
Using XML files 308
Tagging content for XML 308
Structuring documents for XML 314
Exporting to XML 323

Chapter 12: Keyboard shortcuts

Default keyboard shortcuts 325

Chapter 1: What's new

New features summary (circa 2016)

Cleaner and bigger UI

Users often complain about eye strain after using InCopy for a long time, mostly due to small UI elements in InCopy. With this release, the following areas have been enhanced:

- Panels have been redesigned in InCopy by increasing the:
 - Size of various controls in panels.
 - Font size.
 - Inter-spacing between controls (both vertical and horizontal).
- Dialogs have been redesigned by increasing the height of UI controls.

Panels and dialogs now look bigger, cleaner, and less cluttered.

Sorting Swatches

New options are available to sort swatches in the Swatches panel. You can sort swatches by the following:

- Name
- Color Values

Style Override Highlighter

Use the Style Override Highlighter to identify all the paragraph and/or character style overrides applied in your document. You can enable the Style Override Highlighter widget in the Paragraph Styles or Character Styles panel.

Work with glyphs more easily

With the latest OpenType enhancements, apply alternate glyphs for a specific character, and convert text to true fractions, directly from an in-context menu.

Plus, search for a glyph in the Glyphs panel by name, by unicode or GID value, or by the specific character.

Chapter 2: Workspace

Workspace basics

Workspace overview

You create and manipulate your documents and files using various elements, such as panels, bars, and windows. Any arrangement of these elements is called a *workspace*. The workspaces of the different applications in Adobe® Creative Cloud share the same appearance so that you can move between the applications easily. You can also adapt each application to the way you work by selecting from several preset workspaces or by creating one of your own.

Although the default workspace layout varies in different products, you manipulate the elements much the same way in all of them.

- The *Application bar* across the top contains a workspace switcher, menus (Windows only), and other application controls. On the Mac for certain products, you can show or hide it using the Window menu.
- The *Tools panel* contains tools for creating and editing images, artwork, page elements, and so on. Related tools are grouped.
- The *Control panel* displays options for the currently selected tool. In Illustrator, the Control panel displays options for the currently selected object. (In Adobe Photoshop® this is known as the Options bar.)
- The *Document window* displays the file you're working on. Document windows can be tabbed and, in certain cases, grouped and docked.
- *Panels* help you monitor and modify your work. Examples include the Brush panel in Illustrator, and the Layers panel in Adobe Photoshop. Panels can be grouped, stacked, or docked.
- The *Application frame* groups all the workspace elements in a single, integrated window that lets you treat the application as a single unit. When you move or resize the Application frame or any of its elements, all the elements within it respond to each other so none overlap. Panels don't disappear when you switch applications or when you accidentally click out of the application. If you work with two or more applications, you can position each application side by side on the screen or on multiple monitors.

If you are using a Mac and prefer the traditional, free-form user interface, you can turn off the Application frame. In Adobe Illustrator®, for example, select Window > Application Frame to toggle it on or off. But you should not.

Workspace

A Tabbed Document windows B Application bar C Workspace switcher D Panel title bar E Control panel F Tools panel G Collapse To Icons button H Panel groups in vertical dock

Hide or show all panels

- (Illustrator, Adobe InCopy, Adobe InDesign, Photoshop) To hide or show all panels, including the Tools panel and Control panel, press Tab.
- (Illustrator, InCopy, InDesign, Photoshop) To hide or show all panels except the Tools panel and Control panel, press Shift+Tab.

 You can temporarily display hidden panels if Auto-Show Hidden Panels is selected in Interface preferences. It's always on in Illustrator. Move the pointer to the edge of the application window (Windows®) or to the edge of the monitor (macOS) and hover over the strip that appears.

Display panel options

Click the panel menu icon  in the upper-right corner of the panel.

 You can open a panel menu even when the panel is minimized.

 In Photoshop, you can change the font size of the text in panels and tool tips. In the Interface preferences, choose a size from the UI Font Size menu.

Workspace

Reconfigure the Tools panel

You can display the tools in the Tools panel in a single column, or side by side in two columns.

In InDesign and InCopy, you also can switch from single-column to double-column (or single-row) display by setting an option in Interface preferences.

Click the double arrow at the top of the Tools panel.

Manage windows and panels

You can create a custom workspace by moving and manipulating Document windows and panels. You can also save workspaces and switch among them.

Note: *The following examples use Photoshop for demonstration purposes. The workspace behaves the same in all the products.*

Rearrange, dock, or float document windows

When you open more than one file, the Document windows are tabbed.

- To rearrange the order of tabbed Document windows, drag a window's tab to a new location in the group.
- To undock (float or untab) a Document window from a group of windows, drag the window's tab out of the group.

Note: *In Photoshop you can also choose Window > Arrange > Float in Window to float a single Document window, or Window > Arrange > Float All In Windows to float all of the Document windows at once. See tech note [kb405298](#) for more information.*

Note: *Dreamweaver does not support docking and undocking Document windows. Use the Document window's Minimize button to create floating windows (Windows), or choose Window > Tile Vertically to create side-by-side Document windows. Search "Tile Vertically" in Dreamweaver Help for more information on this topic. The workflow is slightly different for Macintosh users.*

- To dock a Document window to a separate group of Document windows, drag the window into the group.
- To create groups of stacked or tiled documents, drag the window to one of the drop zones along the top, bottom, or sides of another window. You can also select a layout for the group by using the Layout button on the Application bar.

Note: *Some products do not support this functionality. However, your product may have Cascade and Tile commands in the Window menu to help you lay out your documents.*

- To switch to another document in a tabbed group when dragging a selection, drag the selection over the document's tab for a moment.

Note: *Some products do not support this functionality.*

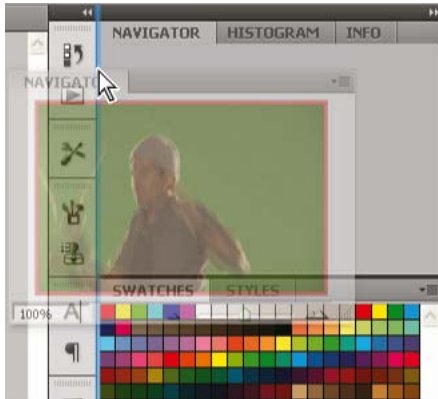

Dock and undock panels

A *dock* is a collection of panels or panel groups displayed together, generally in a vertical orientation. You dock and undock panels by moving them into and out of a dock.

- To dock a panel, drag it by its tab into the dock, at the top, bottom, or in between other panels.
- To dock a panel group, drag it by its title bar (the solid empty bar above the tabs) into the dock.

Workspace

- To remove a panel or panel group, drag it out of the dock by its tab or title bar. You can drag it into another dock or make it free-floating.

💡 You can prevent panels from filling all the space in a dock. Drag the bottom edge of the dock up so it no longer meets the edge of the workspace.

Move panels

As you move panels, you see blue highlighted *drop zones*, areas where you can move the panel. For example, you can move a panel up or down in a dock by dragging it to the narrow blue drop zone above or below another panel. If you drag to an area that is not a drop zone, the panel floats freely in the workspace.

Note: The position of the mouse (rather than the position of the panel), activates the drop zone, so if you can't see the drop zone, try dragging the mouse to the place where the drop zone should be.

- To move a panel, drag it by its tab.
- To move a panel group, drag the title bar.

Workspace

A Title bar B Tab C Drop zone

💡 Press **Ctrl** (Windows) or **Command** (macOS) while moving a panel to prevent it from docking. Press **Esc** while moving the panel to cancel the operation.

Add and remove panels

If you remove all panels from a dock, the dock disappears. You can create a dock by moving panels to the right edge of the workspace until a drop zone appears.

- To remove a panel, right-click (Windows) or Control-click (Mac) its tab and then select Close, or deselect it from the Window menu.
- To add a panel, select it from the Window menu and dock it wherever you want.

Manipulate panel groups

- To move a panel into a group, drag the panel's tab to the highlighted drop zone in the group.

- To rearrange panels in a group, drag a panel's tab to a new location in the group.
- To remove a panel from a group so that it floats freely, drag the panel by its tab outside the group.
- To move a group, drag the title bar (the area above the tabs).

Stack floating panels

When you drag a panel out of its dock but not into a drop zone, the panel floats freely. The floating panel allows you to position it anywhere in the workspace. You can stack floating panels or panel groups so that they move as a unit when you drag the topmost title bar.

- To stack floating panels, drag a panel by its tab to the drop zone at the bottom of another panel.

Workspace

- To change the stacking order, drag a panel up or down by its tab.

Note: Be sure to release the tab over the narrow drop zone between panels, rather than the broad drop zone in a title bar.

- To remove a panel or panel group from the stack, so that it floats by itself, drag it out by its tab or title bar.

Resize panels

- To minimize or maximize a panel, panel group, or stack of panels, double-click a tab. You can also double-click the tab area (the empty space next to the tabs).
- To resize a panel, drag any side of the panel. Some panels, such as the Color panel in Photoshop, cannot be resized by dragging.

Collapse and expand panel icons

You can collapse panels to icons to reduce clutter on the workspace. In some cases, panels are collapsed to icons in the default workspace.

- To collapse or expand all panel icons in a column, click the double arrow at the top of the dock.
- To expand a single panel icon, click it.
- To resize panel icons so that you see only the icons (and not the labels), adjust the width of the dock until the text disappears. To display the icon text again, make the dock wider.
- To collapse an expanded panel back to its icon, click its tab, its icon, or the double arrow in the panel's title bar.

 In some products, if you select *Auto-Collapse Icon Panels* from the *Interface* or *User Interface Options* preferences, an expanded panel icon collapses automatically when you click away from it.

- To add a floating panel or panel group to an icon dock, drag it in by its tab or title bar. (Panels are automatically collapsed to icons when added to an icon dock.)

Workspace

- To move a panel icon (or panel icon group), drag the icon. You can drag panel icons up and down in the dock, into other docks (where they appear in the panel style of that dock), or outside the dock (where they appear as floating icons).

Save and switch workspaces

By saving the current size and position of panels as a named workspace, you can restore that workspace even if you move or close a panel. The names of saved workspaces appear in the workspace switcher in the Application bar.

Save a custom workspace

- 1 With the workspace in the configuration you want to save, do one of the following:
 - (Photoshop, InDesign, InCopy) Choose Window > Workspace > New Workspace.
- 2 Type a name for the workspace.
- 3 (Photoshop, InDesign) Under Capture, select one or more options:
 - Panel Locations** Saves the current panel locations (InDesign only).
 - Keyboard shortcuts** Saves the current set of keyboard shortcuts (Photoshop only).
 - Menus or Menu Customization** Saves the current set of menus.

Display or switch workspaces

Select a workspace from the workspace switcher in the Application bar.

In Photoshop, you can assign keyboard shortcuts to each workspace to navigate among them quickly.

Delete a custom workspace

- Select Manage Workspaces from the workspace switcher in the Application bar, select the workspace, and then click Delete.
- (Photoshop, InDesign, InCopy) Select Delete Workspace from the workspace switcher.

Restore the default workspace

- 1 Select the Default or Essentials workspace from the workspace switcher in the application bar.

Workspace

2 (Photoshop, InDesign, InCopy) Select Window > Workspace > Reset [*Workspace Name*].

(Photoshop) Restore a saved workspace arrangement

In Photoshop, workspaces automatically appear as you last arranged them, but you can restore the original, saved arrangement of panels.

- To restore an individual workspace, choose Window > Workspace > Reset *Workspace Name*.
- To restore all the workspaces installed with Photoshop, click Restore Default Workspaces in the Interface preferences.

To rearrange the order of workspaces in the application bar, drag them.

Change Interface preferences

1 Choose Edit > Preferences > Interface (Windows) or InCopy > Preferences > Interface (macOS).

2 Choose the settings you want to specify, and click OK.

Tool Tips Tool tips appear when you hold the mouse pointer over interface items such as tools in the toolbar and options in the Control panel. Choose None to turn off tool tips.

Show Thumbnails On Place When you place a graphic, a thumbnail of the image appears in the loaded graphics cursor. Similarly, a thumbnail of the first few lines of text appears in the loaded text cursor. Deselect this option if you don't want thumbnails to appear when placing graphics or text.

Show Transformation Values When you're creating, sizing, or rotating an object, the cursor displays the [x,y] coordinates, width and height, or rotation information.

Enable Multi-Touch Gestures Select this option to allow Windows and macOS multi-touch mouse gestures to work in InDesign. For example, when you use the Magic Mouse in macOS, the swipe gesture scrolls up or down or moves to the previous or next page or spread, and the rotate gesture rotates the spread.

Highlight Object Under Selection Tool Select this option to highlight the frame edges of objects when the direct selection tool is moved over it.

Floating Tools Panel Specify whether the toolbar appears as a single column, double column, or single row.

Auto-Collapse Icon Panels When this option is selected, clicking the document window closes the open panel automatically.

Auto-Show Hidden Panels When you hide panels by pressing Tab, holding the mouse pointer over the side of the document window temporarily reveals the panels if this option is selected. If this option is not selected, you must press Tab again to display panels.

Open Documents As Tabs When this option is deselected, documents you create or open appear as floating windows rather than tabbed windows.

Enable Floating Document Window Docking If this option is selected, you can dock floating documents with each other as tabbed windows. If this option is deselected, floating document windows aren't docked with other document windows, unless you hold down Ctrl (Windows) or Command (macOS) while dragging.

Hand Tool To control whether to greek text and images when you scroll a document, drag the Hand Tool slider to the desired level of performance versus quality.

Live Screen Drawing Select an option to determine whether the image redraws as you drag an object. If Immediate is selected, the image redraws while you drag. If Never is selected, dragging an image moves only the frame, and then

Workspace

image is moved when you release the mouse button. If Delayed is selected, the image redraws only if you pause before dragging. Delayed offers the same behavior as in InDesign.

Use toolbars

The basic toolbars contain buttons for many commonly used tools and commands, such as opening, saving, printing, scrolling, and zooming. Tool tips identify each tool button.

Show or hide a toolbar

Choose the toolbar name from the Window menu. A check mark appears next to the toolbar name if it's currently visible.

Customize a toolbar

You can specify which tools appear on a toolbar, change the toolbar orientation, and combine or separate toolbars.

Do any of the following:

- To specify which tools appear on a toolbar, click the triangle at the end of the toolbar, select Customize, and select tools. The menu contains options specific to the toolbar.
- To move a toolbar, drag its title bar.
- To combine toolbars, click the gripper area of a toolbar, and drag the toolbar on top of another or along the same edge of the application window (Windows®) or screen (macOS®).

- To switch a toolbar to a floating panel, click the gripper area of the toolbar and drag the toolbar away from the edge of the application window (Windows) or screen (macOS).
- To separate a grouped toolbar, click the gripper area of the toolbar, and drag the toolbar away from the group. Dragging a toolbar out of an existing group creates a new toolbar.

View tool hints

The Tool Hints panel describes how modifier keys work with the selected tool.

- 1 Choose Window > Utilities > Tool Hints to display the Tool Hints panel.
- 2 Select a tool in the toolbox to view a description of that tool and its modifier keys and shortcuts.

Use context menus

Unlike the menus that appear at the top of your screen, context-sensitive menus display commands related to the active tool or selection. You can use context menus as a quick way to choose commonly used commands.

- 1 Position the pointer over the document, object, or panel.
- 2 Click the right mouse button.

Note: (macOS) If you don't have a two-button mouse, you can display a context menu by pressing the Control key as you click with the mouse.

Customize menus

Hiding and colorizing menu commands is a way to remove menu clutter and emphasize commands you frequently use. Note that hiding menu commands simply removes the menu command from view; it doesn't disable any features. At any time, you can view hidden commands by selecting the Show All Menu Items command at the bottom of a menu, or you can choose Window > Workspace > Show Full Menus to show all the menus for the selected workspace. You can include customized menus in workspaces you save.

You can customize the main menu, context menus, and panel menus. Context menus appear when you right-click (Windows) or Control-click (macOS) an area. Panel menus appear when you click the icon in the upper right of a panel.

Note: If you select a different workspace, such as Getting Started, some menu commands are hidden. To display menu commands, choose Show All Menu Items at the bottom of the menu, or choose a different workspace, such as Advanced.

Create a custom menu set

- 1 Choose Edit > Menus.

You cannot edit the default menu set.

- 2 Click Save As, type the name of the menu set, and click OK.
- 3 From the Category menu, choose Application Menus or Context & Panel Menus to determine which menus are customized.
- 4 Click the arrows to the left of the menu categories to display subcategories or menu commands. For each command you want to customize, click the eye icon under Visibility to show or hide the command; click None under Color to select a color from the menu.
- 5 Click Save, and then click OK.

Select a custom menu set

- 1 Choose Edit > Menus.
- 2 Choose the menu set from the Set menu, and then click OK.

Edit or delete a custom menu set

- 1 Choose Edit > Menus.
- 2 Choose the menu set from the Set menu, and then do one of the following:
 - To edit a menu set, change the visibility or color of menu commands, click Save, and then click OK.
 - To delete a menu set, click Delete and then click Yes. If you've modified the menu set without saving it, you're prompted to save the current menu set. Click Yes to save the menu set, or click No to discard changes.

Workspace

Show hidden menu items

- Choose Window > Workspace > Show Full Menus. This command turns on all menus for the selected workspace. You can hide the menus again by resetting the workspace.
- Choose Show All Menu Items at the bottom of the menu that includes hidden commands.

 *Holding down Ctrl (Windows) or Command (macOS) and clicking a menu name temporarily displays any menu commands you've hidden by customizing menus.*

Use keyboard shortcut sets

InCopy provides keyboard shortcuts for many menu commands, options, scripts, and controls. You can also define your own keyboard shortcuts. Using the Keyboard Shortcuts dialog box, you can:

- Choose the set you want to use.
- View existing shortcut commands.
- Generate a complete list of shortcuts.
- Create your own shortcuts and shortcut sets.
- Edit current shortcuts.

The Keyboard Shortcuts dialog box also lists all commands that can accept shortcuts but don't have shortcuts defined for them in the default shortcut set.

Change the active shortcut set

- 1 Choose Edit > Keyboard Shortcuts.
- 2 Select a shortcut set from the Set menu.
- 3 Click OK.

View shortcuts

- 1 Choose Edit > Keyboard Shortcuts.
- 2 For Set, select a shortcut set.
- 3 For Product Area, select the area containing the commands you want to view.
- 4 From Commands, select a command. The shortcut appears in the Current Shortcuts section.

Generate a list of shortcuts

- 1 Choose Edit > Keyboard Shortcuts.
- 2 Select a shortcut set from the Set menu.
- 3 Click Show Set.

A text file opens with all current and undefined shortcuts for that set.

Create a new shortcut set

- 1 Choose Edit > Keyboard Shortcuts.
- 2 Click New Set.
- 3 Type a name for the new set, select a shortcut set from the Based On Set menu, and click OK.

Create or redefine a shortcut

- 1 Choose Edit > Keyboard Shortcuts.
- 2 For Set, select a shortcut set, or click New Set to create a new shortcut set.
Note: You can make changes to the Default shortcut set, but it's not recommended. Instead, edit a copy of the Default shortcut set.
- 3 For Product Area, select the area containing the command you want to define or redefine.
- 4 In the Commands list, select the command you want to define or redefine.
- 5 Click inside the New Shortcut box and press the keys for your new keyboard shortcut. If the key sequence is currently used for another command, InCopy displays that command under Current Shortcuts. You can change the original shortcut also, or try another shortcut.
Note: Assigning single-key shortcuts to menu commands interferes with entering text. If an insertion point is active when you type a single-key shortcut, InCopy carries out the command instead of inserting the character.
- 6 Do one of the following:
 - Click Assign to create a new shortcut where none currently exists.
 - Click Assign to add another shortcut to the command.
- 7 Click OK to close the dialog box, or click Save to keep the dialog box open and enter more shortcuts.

Viewing stories

Galley, Story, and Layout view overview

InCopy offers three views of a story: Galley, Story, and Layout. These terms correspond to the terms used in traditional publishing.

Galley view Displays text with line breaks established in the corresponding Adobe InDesign® document. If text doesn't fit into the assigned layout space, an overset indicator marks the point at which the InCopy text exceeds the space. Although you can use InCopy to apply formatting, such as paragraph indents and font size, these formats don't appear in Galley view.

Workspace

Story view Displays text in a continuous stream, wrapping the text at the document window. Story view doesn't show accurate line endings, so you can concentrate on content. However, if text doesn't fit into the assigned layout space, an overset indicator marks the point at which the InCopy text exceeds the space. In Story view, the information area displays only paragraph styles. Line numbers aren't visible in Story view.

Story view opens by default when you create a new InCopy story.

 *To change the default view for new documents, close all documents and select the view you want as the default from the View menu.*

Layout view Displays text as it will print, with all formatting. When you use InCopy to synchronize with an InDesign layout, you can view text in context with all other page elements in the InDesign document—frames, columns, graphics, and so on.

Workspace

In Layout view, you can zoom in and out to inspect different aspects of the layout.

Switch between Galley, Story, or Layout view

Do either of the following:

- Choose the view from the View menu.
- Click the Galley, Story, or Layout tab at the top of the editing area.

About Galley view

Galley view provides an environment for efficient text processing; text is easy to read and annotate. You can also use Galley view to perform copyfitting and other production-related tasks.

When you open an InDesign document in InCopy, working in Galley view is analogous to working with galley proofs in traditional typesetting. Within the viewing area, the text wraps exactly as it will in the final InDesign layout, and all text is displayed in one column, regardless of how many columns exist in the layout. Page breaks, frame breaks, and column breaks are shown by a line with the words “Page break,” “Frame break,” or “Column break” in the center of the line.

Note: When multiple breaks are represented by a single boundary, such as a page break coinciding with a frame break, the break with the highest priority is displayed. Page breaks have the highest priority, and column breaks have the lowest.

Galley view includes the Copyfit break feature, which indicates the point at which the InCopy text exceeds the layout space assigned for it in InDesign.

By default, Galley view displays text at 12 points. You can change the font, size, or spacing to make text easier to read or edit. You can also change the background and font colors.

Note: The font display size applies to all stories, rather than individual characters, words, or paragraphs.

The Galley & Story Appearance toolbar at the bottom of the workspace controls several settings that you might want to change frequently when working on a document. These settings include:

- Display font type and size

Workspace

- Display leading (single space, 150% space, double space, or triple space)
- Show/hide line number and styles columns
- Customize Galley & Story Appearance controls

Customize Galley and Story views

You can customize Galley and Story views in a variety of ways.

Change the Galley view display settings

Select an option from the Galley & Story Appearance toolbar. (If the toolbar is hidden, choose Window > Galley & Story Appearance. The toolbar appears at the bottom of the application window by default.)

***Note:** It's important to understand the difference between changing the font display size and applying text formatting. Both can be done in Galley view. Changing the font display size doesn't affect the way text looks in a publication, whereas applying text formatting does change the text appearance in Layout view and in the published document.*

Set Galley view display preferences

1 Choose Edit > Preferences > Galley & Story Display (Windows) or InCopy > Preferences > Galley & Story Display (macOS).

2 In the Text Display Options section, specify the following:

Text Color Controls text color in the viewing area. Black is the default text color.

Background Controls the background color of the viewing area. White is the default background color.

Theme Assigns preset text and background colors.

Override Preview Font Enables you to display one additional font using the correct typeface in the Galley and Story view. InCopy automatically displays the Symbol, Zapf Dingbats, Webdings, and Wingdings® fonts accurately, overriding the display font you've chosen.

Enable Anti-aliasing Smooths the jagged edges of type and bitmap images by softening the color transition between edge pixels and background pixels. Because only the edge pixels change, no detail is lost. You can choose the level of anti-aliasing to apply. The Default option uses shades of gray to smooth text. The LCD Optimized option uses colors, rather than shades of gray, and works best on light-colored backgrounds with black text. The Soft option uses shades of gray, but produces a lighter, fuzzier appearance.

Cursor Options Controls the cursor display. Choose from four different cursors. Select or deselect Blink.

***Note:** Any settings made in the Galley & Story Display section apply to both the Galley and Story views.*

Show or hide the information column

The information column appears on the left side of the document window in Galley and Story views. This column contains read-only information about paragraph styles, line numbers, and the vertical depth of text; you cannot type in this area.

Do one of the following:

- To change the view in the current document only, choose View > Show Info Column or View > Hide Info Column.
- To change the default view in the application, close all documents, and choose View > Show Info Column or View > Hide Info Column.

Workspace

Note: Paragraph styles make it much easier to maintain consistency in your publications. Consult any workflow documentation your team has adopted concerning in-house guidelines for your project.

Set Story view preferences

Use the Galley & Story Display section of the Preferences dialog box to customize the display of the Story view.

- 1 Choose Edit > Preferences > Galley & Story Display (Windows) or InCopy > Preferences > Galley & Story Display (macOS).
- 2 Specify the options you want.
- 3 Click OK.

Show or hide paragraph break marks

You can show or hide paragraph break marks in Galley and Story view. An arrow symbol indicates the start of a new paragraph.

Choose View > Show Paragraph Break Marks or View > Hide Paragraph Break Marks.

Use the vertical depth ruler

When you type text, it's sometimes useful to know the physical depth of a story as it will appear in Layout view, in addition to the number of lines. The vertical depth ruler draws a ruler along the left edge of the Galley and Story views. Each tick mark in the ruler aligns to the bottom of a line of text. A value is displayed every five tick marks to show the total vertical depth of the text to that point. The depth is updated dynamically when layout composition for the portion of the document is complete.

The depth measurement uses the vertical units setting in Units & Increments preferences.

Note: To aid in copyfitting, the depth of overset text is also calculated and displayed.

- 1 Click the Galley or Story tab at the top of the editing area.
- 2 Do either of the following:
 - To show or hide the depth ruler, choose View > Show/Hide Depth Ruler.
 - To show or hide the information column, choose View > Show/Hide Info Column.

Layout view overview

In Layout view, you see text and other elements exactly as they are formatted and positioned in an InDesign document. Stories are laid out in frames, just as they appear in InDesign.

If you work with a *linked* story—a managed story within an open InDesign document or assignment file—you cannot modify the story layout with InCopy. You can work only with the text and text attributes.

If you work with a *stand-alone* InCopy document—an individual InCopy document that isn't within an open InDesign document or assignment file—you can work with the text and text attributes, and you can change the page size using the Document Setup command.

Layout view offers more tools and View-menu commands than the other views. You can use the Hand tool, the Zoom tool, and the Zoom commands to view a spread at various magnifications. You can also use various layout aids, such as rulers, document grids, and baseline grids.

Note: These viewing options don't affect formatting. For example, zooming in to enlarge your view of the page doesn't change the way the story appears in InDesign or when printed.

About frames

In the Layout view of a document in progress, you see one or more boxes on the page. These nonprinting boxes might contain text, graphics, or nothing. The boxes represent *frames*—spaces in the layout reserved for specific elements. Each frame is defined to contain either text or a graphic. Non-managed stories in an InDesign document or in an assignment file are dimmed so that they can be identified easily.

Text frames Control which stories appear where, and how much page area they cover. For linked stories, frames are defined by the InDesign user. If multiple frames are set aside for a story, the frame configuration determines how the story text flows through the layout.

Graphics frames Can function as borders and background, and can crop or mask graphics. You can work with graphics inside frames in InCopy, and you can see the graphics frames from InDesign layouts when you work with linked documents. You can also work with the frames of inline graphics (embedded in text), but you cannot work with other graphics frames.

Empty frames Are *placeholders*. You can distinguish empty text frames from empty graphics frames by their appearance. An empty box represents an empty text frame; a box with an X across it indicates an empty graphics frame. You can add text to an empty text frame only if the frame is associated with the story exported to InCopy from InDesign. You can also import or paste graphics into an empty graphics frame in InCopy.

Show or hide frame edges

Hiding frame edges also hides the X in an empty graphics frame.

In Layout view, choose View > Extras > Show Frame Edges or View > Extras > Hide Frame Edges.

View documents

Use the Zoom tool or View options to zoom in on or out of documents.

Workspace

Zoom in or out

In Layout view, you can magnify or reduce the view of a page. The application bar displays the zoom percentage.

Do any of the following:

- To magnify a specific area, select the Zoom tool  and click the area you want to magnify. Each click magnifies the view to the next preset percentage, centering the display around the point you click. At maximum magnification, the center of the Zoom tool appears blank. To zoom out, hold down Alt (Windows) or Option (macOS) to activate the Zoom Out tool , and click the area you want to reduce. Each click reduces the view to the previous preset percentage.
- To magnify the view to the next preset percentage, activate the window you want to view, and choose View > Zoom In. Choose View > Zoom Out to reduce the view to the previous preset percentage.
- To set a specific magnification level, type or choose a magnification level in the Zoom box in the application bar.
- While pressing Alt (Windows) or Option (macOS), use the mouse scroll wheel or sensor to zoom in or out.

Use power zoom

Power zoom offers a quick way to scroll through your document pages. Using the grabber hand, you can use zoom in or out and scroll through your entire document. This feature is especially useful for long documents.

You must be in Layout view to use power zoom.

- 1 Click the Hand tool .

To activate the grabber hand, you can also hold down the spacebar or hold down Alt/Option while in text mode.

- 2 With the grabber hand active, click and hold down the mouse button.

The document zooms out so that you can see more of the spread. A red box indicates the view area.

- 3 With the mouse button still held down, drag the red box to scroll through the document pages. Press arrow keys or use the mouse scroll wheel to change the size of the red box.

- 4 Release the mouse button to zoom in on the new area of the document.

The document window returns to its original zoom percentage or to the size of the red box.

Magnify by dragging

- 1 Select the Zoom tool .
- 2 Drag to select the area you want to magnify.

 To activate the Zoom In tool while using another tool, press **Ctrl+spacebar** (Windows) or **Command+spacebar** (macOS). To activate the Zoom Out tool while using another tool, press **Ctrl+Alt+spacebar** (Windows) or **Command+Option+spacebar** (macOS).

Workspace**Display the document at 100%**

Do any of the following:

- Double-click the Zoom tool  .
- Choose View > Actual Size.
- Type or choose a magnification level of 100% in the Zoom box in the application bar.

Fit the page, spread, or pasteboard within the active window

Do any of the following:

- Choose View > Fit Page In Window.
- Choose View > Fit Spread In Window.
- Choose View > Entire Pasteboard.

Recovery and undo

Recover documents

InCopy guards your data against unexpected power or system failures using an automatic recovery feature. Automatically recovered data exists in a temporary file that is separate from the original document file on disk. Under normal circumstances you don't need to think about automatically recovered data, because any document updates stored in the automatic recovery file are automatically added to the original document file when you choose the Save or Save As command or exit from InCopy normally. Automatically recovered data is important only if you're unable to save successfully before an unexpected power or system failure.

Even though these features exist, you should save your files often and create backup files in case of unexpected power or system failures.

Find recovered documents

1 Restart your computer.

2 Start InCopy.

If automatically recovered data exists, InCopy automatically displays the recovered document. The word [Recovered] appears after the filename in the title bar of the document window to indicate that the document contains unsaved changes that were automatically recovered.

***Note:** If InCopy fails after attempting to open a document using automatically recovered changes, the automatically recovered data may be corrupted.*

3 Do one of the following:

- For Adobe InCopy® files linked to an InDesign publication, choose File > Save.
- For stand-alone InCopy files, choose File > Save As, specify a location and a new filename, and click Save. The Save As command creates a new file that includes the automatically recovered data.
- To discard any automatically recovered changes and use the last saved version of the file, choose File > Revert Content.

4 Do one of the following:

- To save the recovered data, choose File > Save As, specify a location and a new filename, and click Save. The Save As command keeps the recovered version that includes the automatically recovered data; the word [Recovered] disappears from the title bar.
- To discard automatically recovered changes and use the most recent version of the document that was explicitly saved to disk before the failure occurred, close the file without saving it and open the file on disk, or choose File > Revert.

Change the location of recovered documents

1 Choose Edit > Preferences > File Handling (Windows) or InCopy > Preferences > File Handling (macOS).

2 Under Document Recovery Data, click Browse (Windows) or Choose (macOS).

3 Specify the new location for the recovered document, click Select (Windows) or Choose (macOS), and then click OK.

Undo mistakes

If necessary, you can cancel a lengthy operation before it's completed, undo recent changes, or revert to a previously saved version. You can undo or redo up to several hundred of the most recent actions (the amount is limited by the amount of RAM available and the kinds of actions you performed). The series of actions is discarded when you choose the Save As command, close a document, or when you exit from the program.

Do one of the following:

- To undo the most recent change, choose Edit > Undo [action]. (You cannot undo certain actions, such as scrolling.)
- To redo an action, choose Edit > Redo [action].
- To undo all changes made since the last time you saved the project, choose File > Revert (InDesign) or File > Revert Content (InCopy).
- To close a dialog box without applying changes, click Cancel.

Moving through documents

Scrolling through documents

You can use the scroll bars (along the bottom and right sides of the InCopy window) or scroll with a mouse wheel or sensor in any view.

You can also use the Page Up, Page Down, and arrow keys on the keyboard to move through a story. In Layout view, pressing Page Up or Page Down shifts to the next or previous page in the layout. In Galley or Story view, Page Up and Page Down shift the view by one screen; the view doesn't necessarily go to the next page break. The Up Arrow and Down Arrow keys move the insertion point within the copy and scroll the view as necessary so that you can always see the insertion point.

In Layout view only, you can also use the Hand tool to move the document view in any direction.

Move through a document with the Hand tool

Some options for moving around within a story depend on whether you're working in Galley, Story, or Layout view. In Galley and Story view, you must use the scroll bars to see text that doesn't fit in the view. In Layout view, you can also use the Hand tool, page buttons, and commands.

In Layout view, select the Hand tool , and then drag the document to move it.

 To use power zoom when the Hand tool is selected, hold down the mouse button. This technique offers a quick way to scroll through multiple document pages.

Go to another page in Layout view

Do one of the following:

- Click the buttons in the status bar, as shown in the following illustration.

A First-spread button B Previous-spread button C Page number display box D Next-spread button E Last-spread button

- Choose the page number from the pop-up menu on the status bar.

Jump to position markers

You can set a marker at a specific location in the text so that you can easily return to it using a command or shortcut. A position marker is useful if you change your place in the document to do another action, for example, to verify a fact in another area of text. A document can have only one position marker per session; inserting a marker deletes a previously placed marker. Closing a document also deletes a marker.

Choose **Edit > Position Marker**, and do any of the following:

- To add a marker, place the insertion point in the text and then select **Insert Marker**.
- To replace an existing marker, select **Replace Marker**.
- To delete a marker, select **Remove Marker**.
- To return to a marker, select **Go To Marker**.

Reorder InCopy stories

When you open an assignments file or an InDesign document, you can change the order of the stories in Galley or Story view. Reordering stories doesn't affect their layout position.

- 1 Make sure that you are in Galley or Story view.
- 2 Drag the story's title to a new location.

Customizing preferences and defaults

About preferences

Preferences include settings such as panel positions, measurement options, and display options for graphics and typography.

The difference between preferences and defaults is the area to which each applies. Preference settings specify the initial appearance and behavior of certain InCopy features. Default settings apply to InCopy documents.

***Note:** InCopy preference settings are fully scriptable. To share a consistent set of preferences across user groups, develop a script to set the preferences, and then have all users in the group run the script on their computers. Don't copy and paste one user's preferences files onto another computer, as doing so might cause application instability. For more information about scripting, see the InCopy Scripting Guide on the Adobe website.*

Set defaults

If you change settings when no documents are open, your changes set the defaults for new documents. If a document is open when you change settings, the changes affect only that document.

Similarly, if you change settings when no objects are selected, your changes set the defaults for new objects.

Change default settings for new documents

- 1 Close all documents.
- 2 Change any menu items or panel or dialog box settings.

 *If you use the same page size and language for most of your documents, you can change these defaults with no document open. For example, to change the default page size, close all documents, choose File > Document Setup, and select a desired page size. To set a default dictionary, close all documents, choose Edit > Preferences > Dictionary (Windows) or InCopy > Preferences > Dictionary (macOS), and select an option from the Language menu.*

Specify default settings for new objects in a document

- 1 With document open, choose Edit > Deselect All.
- 2 Change any menu items or panel or dialog box settings.

Restore all preferences and default settings

Do one of the following:

- (Windows) Start InCopy, and then press Shift+Ctrl+Alt. Click Yes when asked if you want to delete the preference files.
- (macOS) While pressing Shift+Option+Command+Control, start InCopy. Click Yes when asked if you want to delete the preference files.

Reset warning dialog boxes

- 1 Choose Edit > Preferences > General (Windows) or InCopy > Preferences > General (macOS).
- 2 Click Reset All Warning Dialogs to display all warnings, even the ones you've already dismissed. (As warnings appear, you can select an option to indicate you do not want to see the warning again.)

Chapter 3: InCopy documents

Create and use InCopy workflows

In Adobe® InCopy®, you can create stand-alone documents, or you can work with documents that are linked to Adobe® InDesign®. When you work with linked documents, you can have more than one InCopy story in an InDesign file, depending on your workflow system. Writers, editors, and designers can work simultaneously on the same InDesign document, without overwriting each other's work.

About InCopy workflows

Tight integration between InCopy and InDesign enables a workflow that lets writers, editors, and designers work simultaneously on the same InDesign document, without overwriting each other's work. The workflow system allows users to check files out and in, thereby preserving file integrity.

InCopy users can view their content contributions within the context of layouts without installing InDesign. Using InCopy, writers and editors can take full control of text, including typesetting functions such as applying formatting styles (usually imported from InDesign), copyfitting, adjusting line and page breaks, setting hyphenation, kerning, and so on. InCopy users can import graphics to enhance their stories, and make limited transformations on those graphics, such as scaling and cropping. After the content is saved in InCopy, the document can be updated in InDesign. In addition, InDesign users can share design updates with InCopy users, ensuring they are working with the latest layouts.

Typically, a system integrator customizes the interaction between InCopy and InDesign, setting up and defining the workflow system for the group. The workflow system controls file creation, synchronization (with the master server), and viewing. InCopy and InDesign work with several different workflow systems, including the built-in system enabled by the InCopy® LiveEdit Workflow plug-ins for small workgroups. For specific details about your workflow system, talk to the system integrator.

About linked (managed) documents

A *linked* InCopy document is a content file (either text or graphics) that is placed in an open InDesign document or assignment file. The content is associated with an InDesign layout, and therefore *managed* by the InDesign document. The InDesign user makes this connection from within InDesign; you cannot create or manage the link from InCopy. The InDesign connection can be made before the InCopy user starts writing and editing text, while the writing is in progress, or after the text work is finished. Once the content is linked, the InCopy user can see (but not change) the page layouts, styles, and so on, as they appear in the InDesign document.

Linked documents have the following additional characteristics:

- With a linked InCopy file, you can do just about anything that concerns the text itself. For example, you can specify text-formatting options, change fonts, and carry out other editing and copyfitting functions within the design and formatting limits of the InDesign layout and your workflow system. You cannot, however, change the text or graphics frames, column layout, threading sequence, or any other design elements; these are set up in InDesign.

- Linked content is managed by your workflow system, where it is locked for access control. Your system might offer several options for opening a linked story, such as checking out each InCopy file so that you alone can work on it. For instructions, see your workflow system documentation or ask your system administrator, or check out content using InCopy if your workflow uses the InCopy LiveEdit Workflow plug-ins.

Working with multistory files

When you work with linked documents, you can have more than one InCopy story in an InDesign file, depending on your workflow system. A file with multiple stories must be created in InDesign as either an assignment file or an InDesign file with linked InCopy content. You cannot use InCopy to create a multistory document. See your workflow system documentation for details.

Multiple stories are shown and separated in Galley and Story views with a *story separator bar*. The story separator bar provides easy access to each story created within an InDesign document.

The story separator bar contains the story title and an expand and collapse button which enables you to show or hide each story. When a story is collapsed, the text is hidden and the story separator bar remains visible within the edit pane.

A Expand and collapse button B Story name C Story separator bar

Transforming graphics

Position tool overview

Click the Position tool  in the toolbox to manipulate selected graphics, either directly, in conjunction with a Transform command (Object > Transform) or a command on a context menu, or by using keyboard shortcuts to nudge the graphic within its frame.

The Position tool is dynamic, automatically changing to reflect different states:

- When placed directly over an empty graphics frame or frame with unassigned content after using the File > Place command, it changes to the loaded graphics icon  to indicate that you can import the graphic into that frame.
- When it's placed directly over a graphic, it changes to the Hand tool to indicate that you can select the graphic and manipulate it within the frame.

InCopy documents

- When placed over the bounding box handle of an inline graphic, it changes to the resize arrow to indicate that dragging will resize the graphic.
- When placed over a graphics frame or the top-level container of nested frames, it changes to the object select icon  to indicate that you can select the graphic or nested frame under the pointer. You cannot select the frame itself.
- When placed over a text frame, it changes to the I-beam  to indicate a text insertion point.

Set Position tool options

When using the Position tool to move a graphic, you can hold down the mouse button for a few seconds to display a dynamic graphics preview (a ghosted-back image) of any part of the image that is outside the frame. You can control the display and delay of the preview.

- 1 Double-click the Position tool  in the toolbox.
- 2 From the Show Masked Portion of Image menu, select the rate at which the entire image will appear while dragging, or select to turn it off entirely.

Transform graphics

You can use commands to move, scale, rotate, and shear graphics.

Move a graphic

- 1 Make sure the frame with the desired object is checked out to you, and then select the object using the Position tool .
- 2 Choose Object > Transform > Move.
- 3 In the Move dialog box, do one of the following:
 - Enter the horizontal and vertical distances that you want the graphic to move. Positive values move the object down and to the right of the x axis; negative values move the object up and to the left.
 - To move an object a precise distance and angle, enter the distance and angle for the move. The angle you enter is calculated in degrees from the x axis. Positive angles specify a counterclockwise move; negative angles specify a clockwise move. You can also enter values between 180° and 360°; these values are converted to their corresponding negative values (for example, a value of 270° is converted to -90°).
- 4 Do one of the following:
 - To preview the effect before you apply it, select Preview.
 - To move the object, click OK.

Scale a graphic

- 1 Make sure the frame with the desired object is checked out to you, and then select the object using the Position tool .
- 2 Choose Object > Transform > Scale.
- 3 In the Scale dialog box, make sure the Constrain Proportions icon is selected if you want to preserve the relative height and width of the object. Deselect this icon if you want to scale the X and Y values separately, which may result in the image being skewed.
- 4 Enter the horizontal and vertical scale values as either percentages (such as 90%) or distance values (such as 6p).
The scale values can be negative numbers.

5 Do one of the following:

- To preview the effect before you apply it, select Preview.
- To scale the object, click OK.

 *To scale the graphic in a specific direction, use the Position tool to drag the handle of a selected graphic. Pressing Shift forces proportional scaling.*

Rotate a graphic

1 Make sure the frame with the desired object is checked out to you, and then select the object using the Position tool

2 Choose Object > Transform > Rotate.

3 Enter the rotation angle, in degrees, in the Angle text box. Enter a negative angle to rotate the object clockwise; enter a positive angle to rotate the object counterclockwise.

4 Do one of the following:

- To preview the effect before you apply it, select Preview.
- To rotate the object, click OK.

Shear a graphic

1 Make sure the frame with the desired object is checked out to you, and then select the object using the Position tool

2 Choose Object > Transform > Shear.

3 In the Shear dialog box, enter the new shear angle.

The shear angle is the amount of slant to be applied to the object, relative to a line perpendicular to the shear axis. (Shear angle is calculated clockwise from the current axis.)

4 Specify the axis along which the object is to be sheared. You can shear an object along a horizontal, a vertical, or an angled axis.

If you choose an angled axis, enter the angle of the axis that you want, in degrees, relative to the perpendicular axis.

5 Do one of the following:

- To preview the effect before you apply it, select Preview.
- To shear the object, click OK.

Clear transformations to a graphic

1 Make sure the frame with the desired object is checked out to you, and then select the object using the Position tool

2 Choose Object > Transform > Clear Transformations.

Stand-alone documents

Work with stand-alone documents

An InCopy document that is not associated with an InDesign document is called a *stand-alone document*. You can set up and modify the text area, page size, and orientation for stand-alone documents. However, if the story is later linked to an InDesign document, the InDesign settings override the settings used in InCopy.

Note: You can also click *Save Preset* to save document settings for future use. When creating a new document, you can simply choose it from the *Document Preset* menu and click *OK* without having to change any settings. If you're working in an editorial workgroup, these saved presets can be shared with other members of your team.

Create a stand-alone document

- 1 Choose File > New.
- 2 To create a document that does not have facing pages in each spread, deselect Facing Pages.
- 3 From the Text Area menu, choose Frame Grid to create a document with a grid into which Japanese characters are set, or choose Text Frame to create a plain text frame.
- 4 Under Text Area, type values for Width and Depth. Text dimensions provide accurate line break information without relying on InDesign for copyfit information.
- 5 Specify whether the text direction is horizontal or vertical.
You can change this setting any time by choosing Type > Writing Direction > Horizontal or Vertical.
- 6 In the Grid Attributes section, specify the frame grid characteristics for vertical and horizontal scaling.
- 7 Choose a page size from the list, or type values for Width and Height. Page size represents the final size you want after bleeds or other marks outside the page are trimmed.
- 8 Click OK.

Open a stand-alone document

You can open an InCopy content file (.icml) that has been created in InCopy or exported from InDesign. When opened in InCopy, these InCopy content files will not show the page geometry from the InDesign layout. You can also open documents from previous versions of InCopy, and you can open InCopy template files (.icmt).

You can also open Microsoft® Word and text files directly in InCopy, and then save them as Text Only (.TXT) or Rich Text Format (.RTF).

- 1 Choose File > Open.
- 2 Select the document, and then click Open.

You can also choose File > Open Recent, and select one of the documents you saved recently. To specify how many recent documents are displayed, choose Edit > Preferences > File Handling (Windows), or InCopy > Preferences > File Handling, and then specify a number for Number Of Recent Items To Display.

Change document layout

- 1 In any view of a stand-alone document, choose File > Document Setup.
- 2 Select basic layout options in the dialog box that appears.
- 3 Click OK.

Define custom document presets

You can create custom document settings and then share them with others in your workgroup to save time and ensure consistency when creating similar documents.

- 1 Choose File > Document Presets > Define.
- 2 Do one of the following:
 - To create a new preset, click New and specify a name for the preset.
 - To base a preset on an existing one, select a preset from the list and click Edit.
 - To use a different set of settings, click Load, open a document settings file (.icst), and then click Edit.
- 3 Select basic layout options in the dialog box that appears.
- 4 Click OK twice.

You can save a document preset to a separate file and distribute it to other users. To save and load document preset files, use the Save and Load buttons in the Document Presets dialog box.

Linking InCopy files to InDesign

When a stand-alone InCopy story is linked to an InDesign document, the InDesign formatting overrides the InCopy layout and design settings.

The link between InCopy files and InDesign layouts can be made a number of ways in InDesign, usually by placing an InCopy (.icml) file into an InDesign layout.

Using Adobe Bridge with InCopy

Adobe Bridge is a cross-platform application included with Adobe Creative Cloud components that helps you locate, organize, and browse the assets you need to create print, web, video, and audio content. You can start Adobe Bridge from any Creative Cloud component (except Adobe Acrobat), and use it to access both Adobe and non-Adobe asset types.

From Adobe Bridge, you can:

- Manage image, footage, and audio files: Preview, search, sort, and process files in Adobe Bridge without opening individual applications. You can also edit metadata for files, and use Adobe Bridge to place files into your documents, projects, or compositions.
- View the links inside an InDesign or InCopy document as thumbnails while in Adobe Bridge, without actually having to open the document.
- Perform automated tasks, such as batch commands.
- Synchronize color settings across color-managed Creative Cloud components.
- Start a real-time web conference to share your desktop and review documents.

Browse for files by using Adobe Bridge

Adobe Bridge lets you efficiently organize, browse, and locate the assets you need to create content for print, the web, and mobile devices.

To open the Adobe Bridge Browser, choose File > Browse In Bridge or click the Adobe Bridge icon  in the application bar.

Scripting in InCopy

Scripting is a great tool for performing a variety of tasks. A script can be as simple as an automated common task or as complex as an entire new feature. You can create your own scripts, and you can run scripts that other people have created. Use the Scripts panel (Window > Utilities > Scripts) to run scripts within InCopy.

Saving and exporting

Save documents

Do one of the following:

- To save an existing document under the same name, choose File > Save Content.
- To save a document under a new name, choose File > Save Content As, specify a location and filename, and click Save. The newly named document becomes the active document.
- To save a copy of a story or graphic under a new document name, choose File > Save Content Copy, specify a location and filename, and click Save. The saved copy does not become the active document.
- To save a copy of a document as a template, choose File > Save Content As, specify a location and filename, and then choose InCopy Template from Save As Type (Windows) or Format (macOS).
- To save all stories in the document, choose File > Save All Content.
- To save a copy of a document in a text format, choose File > Save Content As, specify a location and filename, and then choose Text Only or Rich Text Format from Save As Type (Windows) or Format (macOS).

Note: Saving a managed (linked) document does not update the link in the InDesign file. To update the story on the file system, follow the process described in your workflow system documentation or ask your system administrator for information.

Include previews in saved documents

Thumbnail previews of documents and templates provide easy identification of those files in Adobe Bridge. A preview is created when you save a document or template. A document preview includes a JPEG image of only the first spread; a template preview includes a JPEG image of each page in the template. You can control the size of the preview and the number of pages to suit your needs. For example, Extra Large 1024x1024 enables you to quickly scan the contents of a page at high-resolution before you open the file.

InCopy documents

You can enable the option in Preferences or in the Save As dialog box. Because previews increase both file size and the time it takes to save the document, you may prefer to enable the option on demand using the Save As dialog box.

1 Do one of the following:

- To include a preview every time you save a document, choose Edit > Preferences > File Handling (Windows) or InCopy > Preferences > File Handling (macOS).
- To include a preview for a specific document, choose File > Save As.
- To include a preview for a specific document, choose File > Save Content As.

2 Select Always Save Preview Images With Documents.

3 If you are setting the preview using the Preferences dialog box, choose the number of preview pages from the Pages menu, and choose an option from the Preview Size menu.

Note: Selecting the preview option in the Save As dialog box also selects the option in the Preferences dialog box, and uses the default Pages and Preview Size settings.

InCopy file types

You can work with several different file types in InCopy.

InCopy content files (.icml) This is the default file type when exporting stories or graphics from InDesign, and when saving or creating new documents using InCopy. This file type appears as InCopy Document in the Export or Save As dialog box.

InCopy CS3 Interchange files (.incx) This is a legacy file type used in InCopy CS3 and earlier.

Assignment files (.icma) These files are a subset of an InDesign document. They display content and styles, as well as page geometry from the parent InDesign file. Assignment files can display different levels of visual fidelity (wireframe, assigned spreads, or all spreads). The InDesign user sets these options while creating the assignment file. Only InDesign users can *create* assignment files; only InCopy users can *open* assignment files.

Legacy assignment files for InCopy CS3 used the .inca extension.

Assignment package files (.icap) These files are assignment files that have been compressed in InDesign for distribution. Assignment packages include the assignment file, the assigned story files, and any linked images.

Legacy InCopy CS3 assignment packages used the .incp extension.

Template files (.icmt) Templates are useful starting points for stand-alone documents, because you can preset them with page size dimensions, text area dimensions, styles (paragraph and character), XML tags, swatches, pretagged sample content, and so on. Template files open as “Untitled” documents and display content and styles, but no page geometry (layout information from an InDesign document). This file type appears as InCopy Template in the Save As dialog box.

InDesign files (.indd) When viewed in InCopy, these files provide full fidelity with the InDesign document, including content, styles, and layout of all page items. InCopy users can edit only those content items made available to them by InDesign users. Other items can be viewed but not edited.

You can open several different types of text files, including Microsoft Word, RTE, and TXT files, directly in InCopy. When you do so, the import options for that file type appear.

Export InCopy documents

You can save all or part of an InCopy document in a different file format. In most cases, each component (for example, text frames and graphics) in an InCopy document is exported to a separate file. The exception is exporting an InCopy document to Adobe PDF, which copies all of the text and graphics in a document to a single PDF file.

1 Do one of the following:

- To export text, click in the text with the Type tool .
- To export a graphic, click the graphic with the Position tool .

2 Choose File > Export.

3 Specify a name and location for the exported content, and then select a format under Save As Type.

The XML format appears in the list only if XML tags have been added to the document. If you are exporting text and don't see a listing for your word-processing application, you might need to export the text in a format that the application can import, such as Rich Text Format. If your word-processing application doesn't support any of the InCopy export formats, use the Text Only (ASCII) format.

***Note:** Exporting in ASCII format removes all character attributes from the text. To retain all formatting, use the InCopy Tagged Text export filter.*

4 Click Save to export the content in the format you've selected.

Rename InCopy stories

When a story is exported from InDesign, it is given a document filename with a .icml extension. InCopy automatically uses this filename as the story name that appears in the Assignments panel in InDesign and the story separator bar. Unlike the *filename*, the *story name* is embedded in the file.

1 To change a story name manually, open a story file in InCopy.

2 Choose File > Content File Info.

3 Make sure that the Description tab is selected, and then type a new name for Document Title.

***Note:** Depending on the workflow processes of your system, an administrator might have to change the story name for you. If you are unable to rename the story by following the steps above, talk to your workflow administrator.*

You can also change the story name in the Assignments panel when the story is checked out. However, the filename is not changed on disk.

Importing graphics

Import graphics

InCopy allows you to import graphics into existing frames. This is especially useful where content is created before the layout, because you can choose the graphics for your articles as you write.

You can import graphics into existing frames only. Only InDesign users can create graphics frames. In standalone InCopy documents, you can insert a graphic into the default text frame, making it an inline graphic.

InCopy supports the same wide range of graphics file formats as InDesign, including graphics created using Adobe® Illustrator® 8.0 and later, bitmap formats such as PDF, PSD, TIFF, GIF, JPEG, and BMP, and vector formats such as EPS. You can even import InDesign (INDD) pages as images. Other supported formats include DCS, PICT, WMF, EMF, PCX, PNG, and Scitex CT (.SCT).

Notes on placing graphics in InCopy

When you import graphics into InCopy, keep the following in mind:

- For managed content, you must check out a frame before you can import a graphic into it.
- Once you import a graphic, you can transform (move, scale, rotate, shear) it inside the frame, fit the graphic to the frame, and control the graphic's appearance. You can also tag a selected frame for future XML use by selecting commands from the context menu.
- When InDesign users create a new frame, they specify whether it is a text, graphics, or unassigned frame. InCopy users cannot change this frame type within InCopy. Therefore, if you try to import a graphic into a text frame, for example, it may appear as a large inline graphic.
- You can select and modify the graphics but not the frames in InCopy, unless they are nested or inline frames. Only InDesign users can modify graphics frames.
- You can place, paste, or drag graphics into an anchored, floating, or inline graphics frame. You can import a graphic into a text frame only if that frame has an active insertion point or is an inline graphics frame.
- If you import a graphic into a nested frame, the graphic is imported into the deepest-level frame under the pointer. Nested frames that contain graphics, unlike top-level frames, can be selected with the Position tool. (See [Position tool overview](#).)
- If an effect, such as transparency, drop shadow, or feathering, is applied to a frame in InDesign, it will be visible in an assignment file or InDesign (.indd) file open in InCopy. It will not be visible in a linked (.icml) file open in InCopy.

Place a graphic in an InCopy document

1 Do one of the following:

- To place a graphic in a standalone InCopy document, place the insertion point in the text frame.
- To place a graphic in a linked document, make sure the graphics frame is checked out to you. The Editing icon  appears in the upper left corner of the frame.

2 Choose File > Place and select a graphics file.

3 To set format-specific import options, select Show Import Options to see format-specific settings, and then click Open.

Note: When you place a graphic created in Illustrator 9.0 or later by using the Show Import Options dialog box, the options are identical to those for PDF files. When you place an Illustrator 8.x graphic, the options are identical to those for EPS files.

4 If another dialog box appears, select your import options, and click OK.

5 To import into a frame, click the loaded graphics icon  in the frame. To place a specified page of a multipage PDF document, click the loaded graphics icon in a frame.

 If you accidentally replace an existing graphic with an image you're placing, press Ctrl+Z (Windows) or Command+Z (macOS) to return the original image to the frame and display the loaded graphics icon.

Drag a graphic into a frame

Do one of the following:

- To place a graphic in an existing graphics frame, make sure the frame is checked out to you, and then drag the graphic file's icon from the file system to the frame.
- To place a graphic at an active text insertion point, drag the graphic file's icon to any place in the text frame. This method is available only in Layout view.

Paste a graphic into a frame

1 Make sure the graphics frame is checked out to you. The Editing icon  appears in the upper left corner of the frame.

2 Cut or copy a graphic.

3 Hold the Hand tool over the graphics frame, right-click (Windows) or Control-click (macOS), and then choose Paste Into.

Create an inline graphic

1 Make sure the text frame is checked out to you. The Editing icon  appears in the upper left corner of the frame.

2 Do one of the following:

- To place a graphic in an existing inline graphics frame, use the Place or Cut command to select a graphic. Click the loaded graphics icon in the frame.
- To place a graphic at an active text insertion point, drag the graphic file's icon to any place in the text frame, or use the Place command to import the graphic.

Import options for graphics

The options for importing graphics vary depending on the type of image being imported. To display import options, make sure that Show Import Options is selected in the Place dialog box.

Encapsulated PostScript (.eps) import options

When you place an EPS graphic (or a file saved with Illustrator 8.0 or earlier) and select Show Import Options in the Place dialog box, you'll see a dialog box containing these options:

Read Embedded OPI Image Links This option tells InCopy to read links from OPI comments for images included (or nested) in the graphic.

Deselect this option if you're using a proxy-based workflow and plan to have your service providers perform the image replacement using their OPI software. When this option is deselected, InDesign preserves the OPI links but does not read them. When you print or export, the proxy and the links are passed on to the output file.

Select this option if you're using a proxy-based workflow and you want InDesign, instead of your service provider, to perform image replacement when you output the final file. When you select this option, the OPI links appear in the Links panel.

Also select this option when you import EPS files containing OPI comments that are not part of a proxy-based workflow. For example, if you import an EPS file containing OPI comments for an omitted TIFF or bitmap image, you'll want to select this option so that InDesign can access the TIFF information when you output the file.

Apply Photoshop Clipping Path Regardless of whether this option is selected, a placed EPS file includes a clipping path in InDesign. However, deselecting this option may result in a different bounding box size.

Proxy Generation This creates a low-resolution bitmap representation of an image when drawing the file to the screen. The following settings control how the proxy will be generated:

Use TIFF Or PICT Preview Some EPS images contain an embedded preview. Select this option to generate the proxy image of the existing preview. If a preview does not exist, the proxy will be generated by rasterizing the EPS to an offscreen bitmap.

Rasterize The PostScript Select this option to ignore the embedded preview. This option is typically slower but provides the highest-quality results.

Note: When you import more than one single file into the same document, all instances share the proxy setting of the first instance of the imported file.

Bitmap import options

You can apply color-management options to individual imported graphics when using color-management tools with a document. You can also import a clipping path or an alpha channel saved with an image created in Photoshop. Doing so lets you directly select an image and modify its path without changing the graphics frame.

Note: Although Adobe InCopy does not include color-management options, these import options are relevant when the images you place in InCopy are transferred to InDesign.

When you place a PSD, TIFF, GIF, JPEG, or BMP file and select Show Import Options in the Place dialog box, you'll see a dialog box containing these options:

Apply Photoshop Clipping Path If this option isn't available, the image wasn't saved with a clipping path, or the file format doesn't support clipping paths. If the bitmap image doesn't have a clipping path, you can create one in InDesign.

Alpha channel Select an alpha channel to import the area of the image saved as an alpha channel in Photoshop. InCopy uses the alpha channel to create a transparent mask on the image. This option is available only for images that contain at least one alpha channel.

Click the Color tab to view the following options:

Profile If Use Document Default is selected, leave this option unchanged. Otherwise, choose a color source profile that matches the gamut of the device or software used to create the graphic. This profile enables InDesign to properly translate its color to the gamut of the output device.

Rendering Intent Choose a method for scaling the color range of the graphic to the color range of the output device. Typically, you'll choose Perceptual (Images) because it accurately represents colors in photographs. The Saturation (Graphics), Relative Colorimetric, and Absolute Colorimetric options are better for areas of solid color; they don't reproduce photographs well. Rendering Intent options aren't available for bitmap, grayscale, and index-color mode images.

Portable Network Graphics (.png) import options

When you place a PNG image and select Show Import Options in the Place dialog box, you'll see a dialog box with three sections of import settings. Two sections contain the same options available for other bitmap image formats. The other section, PNG Settings, contains the following settings:

Use Transparency Information This option is enabled by default when a PNG graphic includes transparency. If an imported PNG file contains transparency, the graphic interacts only where the background is transparent.

White Background If a PNG graphic does not contain a file-defined background color, this option will be selected by default. However, it is only enabled if Use Transparency Information is activated. If this option is selected, white is used as the background color when applying transparency information.

File Defined Background Color If a PNG graphic was saved with a non-white background color, and Use Transparency Information is selected, this option is selected by default. If you don't want to use the default background color, click White Background to import the graphic with a white background, or deselect Use Transparency Information to import the graphic without any transparency (displaying areas of the graphic that are currently transparent). Some image-editing programs can't specify a non-white background color for PNG graphics.

Apply Gamma Correction Select this option to adjust the gamma (midtone) values of a PNG graphic as you place it. This option lets you match image gamma to the gamma of the device you will use to print or display the graphic (such as a low-resolution or non-PostScript printer or computer monitor). Deselect this option to place the image without applying any gamma correction. By default, this option is selected if the PNG graphic was saved with a gamma value.

Gamma Value This option, available only if Apply Gamma Correction is selected, displays the gamma value that was saved with the graphic. To change the value, type a positive number from 0.01 to 3.0.

When PNG files are imported, the settings in the Image Import Options dialog box are always based on the selected file, not on the default or last-used settings.

Acrobat (.pdf) and Illustrator (.ai) import options

The layout, graphics, and typography in a placed PDF are preserved. As with other placed graphics, you cannot edit a placed PDF page within InCopy. You can control the visibility of layers in a layered PDF. You can also place more than one page of a multipage PDF.

When you place a PDF that was saved with passwords, you'll be prompted to enter the required passwords. If the PDF file was saved with usage restrictions (for example, no editing or printing), but no passwords, you can place the file.

InCopy documents

When you place a PDF (or a file saved with Illustrator 9.0 or later) and select Show Import Options in the Place dialog box, you'll see a dialog box containing the following options:

Show Preview Preview a page in the PDF before you place it. If you're placing a page from a PDF that contains multiple pages, click the arrows, or type a page number under the preview image to preview a specific page.

Pages Specify the pages you want to place: the page displayed in the preview, all pages, or a range of pages. For Illustrator files, you can specify which artboard to place.

 *If you specify multiple pages, hold down Alt (Windows) or Option (macOS) while placing the file to place them all at the same time, overlapping each other.*

Crop To Specify how much of the PDF page to place:

Bounding Box Places the PDF page's bounding box, or the minimum area that encloses the objects on the page, including page marks. The Bounding Box (Visible Layers Only) option uses the bounding box only of the visible layers of the PDF file. The Bounding Box (All Layers) option places the bounding box of the entire layer area of the PDF file, even if layers are hidden.

Art Places the PDF only in the area defined by a rectangle that the author created as a placeable artwork (for example, clip art).

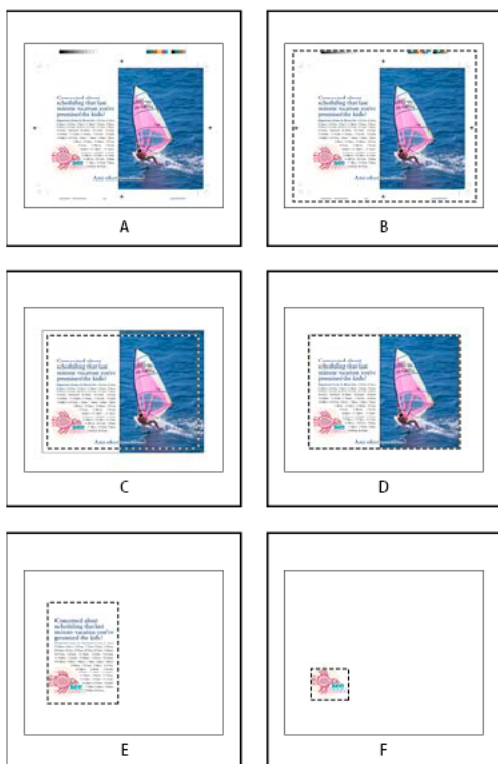

Crop Places the PDF only in the area that is displayed or printed by Adobe Acrobat.

Trim Identifies the place where the final produced page will be physically cut in the production process, if trim marks are present.

Bleed Places only the area that represents where all page content should be clipped, if a bleed area is present. This information is useful if the page is being output in a production environment. Note that the printed page may include page marks that fall outside the bleed area.

Media Places the area that represents the physical paper size of the original PDF document (for example, the dimensions of an A4 sheet of paper), including page marks.

InCopy documents

A Media B Trim C Bleed D Content E Crop F Art

Transparent Background Select this option to reveal text or graphics that fall beneath the PDF page in the InCopy layout. Deselect this option to place the PDF page with an opaque white background.

 *If you make the background transparent in a frame containing a PDF graphic, you can make it opaque later by adding a fill to the frame.*

InDesign (.indd) import options

InDesign preserves the layout, graphics, and typography in a placed INDD file. However, the file is treated as an object, and you can't edit it, although you can control the visibility of layers and choose which pages of a multi-page INDD file to import.

When you place an InDesign file and select Show Import Options in the Place dialog box, you'll see a dialog box containing the following options:

Show preview Preview a page before you place it. You can type a page number or click the arrows to preview a page in a multi-page document.

Pages Specify the pages you want to place: the page displayed in the preview, all pages, or a range of pages.

Crop to Specify how much of the page or pages to place, the page itself or the bleed or slug areas on the pasteboard.

Fit a graphic to its frame

When you place or paste a graphic into a frame, it appears at the upper left corner of the frame by default. If the frame and its content are different sizes, you can use the Fitting commands to achieve a perfect fit.

1 Select the graphic with the Position tool .

InCopy documents

2 Choose Object > Fitting and one of the following options:

Fit Content To Frame Resizes content to fit a frame and allows the content proportions to be changed. The frame will not change, but the content may appear to be stretched if the content and the frame have different proportions.

Center Content Centers content within a frame. The proportions of the frame and its content are preserved.

Fit Content Proportionally Resizes content to fit a frame while preserving the content proportions. The frame's dimensions are not changed. If the content and the frame have different proportions, some empty space will result.

Fill Frame Proportionally Resizes content to fit a frame completely while preserving the content proportions. The frame's dimensions are not changed.

Note: The Fitting commands fit the content outer edges to the center of the frame's stroke. If the frame has a thick stroke weight, outer edges of the content will be obscured. You can adjust the frame's stroke alignment to the center, inside, or outside of a frame edge.

Links panel overview

All files placed in a document are listed in the Links panel. These include both local (on disk) files and assets that are managed on a server. However, files that are pasted from a website in Internet Explorer do not display in this panel.

In InCopy, the Links panel also displays linked stories. When you select a linked story in the Links panel, the Link Info section displays information such as the number of notes, the managed status, and the status of tracked changes.

A Category columns B Show/Hide Link Information C One or more instances modified icon D Modified icon E Missing-link icon F Embedded-link icon

When the same graphic appears several times in the document, the links are combined under a disclosure triangle in the Links panel. When a linked EPS graphic or InCopy document contains links, the links are also combined under a disclosure triangle.

A linked file can appear in the Links panel in any of the following ways:

Up to Date An up-to-date file is blank in the Status column.

Modified This icon means that the version of the file on disk is more recent than the version in your document. For example, this icon appears if you import a Photoshop graphic into InCopy, and then you or someone else edits and saves the original graphic in Photoshop.

InCopy documents

A slightly different version of the Modified icon appears when a graphic is modified and one or more instances are updated while others are not.

Missing The graphic is no longer in the location from which it was imported, although it may still exist somewhere. Missing links can happen if someone deletes the original file or moves it to a different folder or server after it's been imported. You can't know whether a missing file is up to date until its original is located. If you print or export a document when this icon is displayed, the file may not print or export at full resolution.

Embedded Embedding the contents of a linked file suspends management operations for that link. If the selected link is currently in an "edit in place" operation, this option is not enabled. Unembedding the file restores management operations to the link.

If a linked object does not appear on a specific document page, the following codes indicate where the object appears: PB (pasteboard), MP (master page), OV (overset text), and HT (hidden text).

Use the Links panel

- To display the Links panel, choose Window > Links. Each linked file and automatically embedded file is identified by name.
- To select and view a linked graphic, select a link in the Links panel and then click the Go To Link button , click the page number of the link in the Page column, or choose Go To Link in the Links panel menu. InCopy centers the display around the selected graphic. To view a hidden object, you show the layer (or condition if it's an anchored object).
- To expand or collapse nested links, click the triangle icon to the left of the link. Nested links occur when the same graphic appears several times in the document or when the linked EPS graphic or InCopy document contains links.
- To sort links in the panel, click the category title at the top of the Links panel to sort by that category. Click the same category again to reverse the order. For example, if you click the Page category, the links appear in their order from the first page to the last page. If you click Page again, the links are sorted from last page to first. Use Panel Options to add columns to the Links panel.

Work with Links panel columns

You can display additional categories, such as Creation Date and Layer, in the Links panel to display more information about the graphics. For each category, you can determine whether the information appears as a column in the Links panel and in the Link Info section at the bottom of the Links panel.

- 1 Choose Panel Options from the Links panel menu.
- 2 Select the check boxes under Show Column to add columns in the Links panel.
Folder 0 is the folder that contains the linked file; Folder 1 is the folder that contains Folder 0, and so on.
- 3 Select the check boxes under Show In Link Info to display the information in the Link Info section at the bottom of the Links panel.
- 4 Click OK.

You can change the order of columns by selecting a column and dragging it to a different location. Drag the column boundaries to change the column width. Click a category title to sort the links by that category in ascending order. Click again to sort in descending order.

Change the Links panel rows and thumbnails

- 1 Choose Panel Options from the Links panel menu.
- 2 For Row Size, select Small Rows, Regular Rows, or Large Rows.
- 3 For Thumbnails, determine whether thumbnail representations of the graphics appear in the Name column and in the Link Info section at the bottom of the Links panel.
- 4 Click OK.

Display link information

The Link Info section of the Links panel lists information about the selected linked file.

To change the information displayed in the Link Info section of the Links panel, choose Panel Options from the Links panel menu, and select check boxes in the Show In Link Info column.

Double-click a link, or select a link and click the Show/Hide Link Information icon, which is a triangle on the left side of the panel.

View metadata via the Links panel

If a linked or embedded file contains metadata, you can view the metadata using the Links panel. You cannot edit or replace metadata associated with a linked file.

Select a file in the Links panel and choose Utilities > XMP File Info from the panel menu.

Update, restore, and replace links

Use the Links panel to check the status of any link, or to replace files with updated or alternate files.

When you update or reestablish (relink) a link to a file, any transformations performed in InCopy are preserved (if you choose Relink Preserved Dimensions in the File Handling preferences). For example, if you import a square graphic and rotate it 30°, and then you relink it to an unrotated graphic, InCopy rotates it 30° to match the layout of the graphic it's replacing.

Note: *Placed EPS files may contain OPI links, which appear in the Links panel. Don't relink OPI links to files other than those originally intended by the creator of the EPS file; doing so can cause problems with font downloading and color separations.*

Choose how relinked graphics are scaled

When you relink to replace one graphic with a different source file, you can keep the image dimensions of the file that's being replaced, or you can display the incoming file in its actual dimensions.

- 1 Choose Edit > Preferences > File Handling (Windows) or InCopy > Preferences > File Handling (macOS).
- 2 Choose Preserve Image Dimensions When Relinking if you want images to appear at the same size as the images they're replacing. Deselect this option to have relinked images appear at their actual size.

Update modified links

InDesign first looks for a missing link in the folder in which another file has been relinked in the current session. Next, it looks for a link in the same folder where the document is located. If it's still not found, it looks in the parent folder of the document.

Modified links are also called “out of date” links.

In the Links panel, do one of the following:

- To update specific links, select one or more links marked with the modified-link icon . Then click the Update Link , or choose Update Link from the Links panel menu.
- To update all modified links, choose Update All Links from the Links panel menu, or select a modified link and Alt-click (Windows) or Option-click (macOS) the Update Link button.
- To update only one link to a graphic that appears in several places in the document, select only the sublink and choose Update Link. If you select the “parent” link, you can update all links to the modified graphic.

Replace a link with a different source file

- 1 Select any link in the Links panel, and click the Relink button  or choose Relink from the Links panel menu. If a “parent” link of multiple instances is selected, choose Relink All Instances Of *[Filename]* from the Links panel menu.

Relink is disabled in managed stories unless a story is checked out.

- 2 In the dialog box that appears, select Search For Missing Links In This Folder if you want InCopy to search the folder for files that have the same names as other missing linked files. If this option is not selected, only the selected image is relinked.
- 3 Choose Show Import Options to control how the new source file is imported.
- 4 Locate and double-click the new source file.
- 5 Choose import options if you clicked the Show Import options option.

Restore missing links

- 1 To restore a missing link, select any link marked with the missing link icon  in the Links panel, and click the Relink button .
- 2 In the dialog box that appears, select Search For Missing Links In This Folder to relink any missing file that appears in the specified folder. Locate and double-click a file.

Find missing links

By default, InCopy checks for missing links and tries to resolve them when you open a document. Two preference options let InCopy check for and find missing links automatically when you open a document.

Check Links Before Opening Document If you turn off this option, InCopy opens the document immediately, and the link statuses remain pending until links are determined to be up-to-date, missing, or modified. If you turn on this option, InCopy checks for modified or missing links.

Find Missing Links Before Opening Document If you turn off this option, InCopy does not attempt to resolve the missing links. You may want to turn off this option if links slow performance to a server or if unexpected linkings occur. This option is dimmed if Check Links Before Opening Document is turned off.

Search For Missing Links Use the Search For Missing Links command to search for and resolve missing links in your document. This command is useful if you turned off the preferences option that checks for missing links when you open a document, and now you have missing links. This command is also useful if you mount a server where images are stored after opening a document.

- To change link settings, open the File Handling section of the Preferences dialog box, and determine whether the Check Links Before Opening Document and Find Missing Links Before Opening Document options are selected.

- To let InCopy attempt to resolve missing links, choose Utilities > Search For Missing Links from the Links panel menu.

This command is dimmed if the document contains no missing links.

Specify a default Relink folder

- 1 In the Preferences dialog box, select File Handling.
- 2 From the Default Relink Folder menu, choose either of the following options, and then click OK:
 - Most Recent Relink Folder** This option displays the most recently used folder you selected when relinking, matching InCopy CS3 behavior.
 - Original Link Folder** This option displays the original location of the linked file, matching the behavior of InCopy CS2 and earlier.

Copy links to a different folder

Use the Copy Link(s) To command to copy graphics files to a different folder and redirect the links to the copied files. This command is especially useful for moving files to a different drive, such as moving files from a DVD to a hard drive.

- 1 Select the links to the files you want to copy, and choose Utilities > Copy Link(s) To from the Links panel menu.
- 2 Specify the folder where the linked files will be copied and choose Select (Windows) or Choose (macOS).

Relink to a different folder

When you use the Relink To Folder command, you can point to a folder that contains files with the same names as your out-of-date links. For example, if your current links point to low-resolution images, you can specify a different folder that contains high-resolution images. You can specify a different extension for the files, allowing you to change links from .jpg to .tiff, for example.

The Relink To Folder command is dimmed in a managed InCopy story unless the story is checked out.

- 1 Select one or more links in the Links panel.
- 2 Choose Relink To Folder from the Links panel menu.
- 3 Specify the location of the new folder.
- 4 To use a different extension, select Match Same Filename But This Extension, and specify the new extension (such as AI, TIFF, or PSD).
- 5 Click Select (Windows) or Choose (macOS).

Relink files with different file extensions

The Relink File Extension command lets you replace images based on file extensions. For example, if you have several JPEG images in your document, you can replace them with PSD files. The files with different extensions must be in the same folder as the linked files being replaced.

- 1 Make sure the files with different file extensions appear in the same folder as the original files.
- 2 Select one or more links in the Links panel.
- 3 Choose Relink File Extensions from the Links panel menu.
- 4 Specify the file extension to replace the selected files, and click Relink.

Replace an imported file using the Place command

- 1 Do one of the following:
 - To replace the contents of a graphics frame, such as an imported graphic, use the Selection tool  to select the frame.

To replace the contents of a graphics frame, such as an imported graphic, use the Position tool to select the image.
 - To replace the contents of a text frame, use the Type tool to click an insertion point in a text frame, and choose Edit > Select All.
- 2 Choose File > Place.
- 3 Locate and select the new file.
- 4 Make sure that Replace Selected Item is selected, and then click Open.
- 5 Click Open.

Copy the link pathname

You can copy either the full path of the linked image or the platform style path. Copying the full path of the image is useful for notifying team members where art is located. For example, you can copy the full path and paste it into an email message. Copying the platform path is useful for scripting or for specifying image fields in a data merge.

- 1 Select a link in the Links panel.
- 2 From the Links panel menu, choose Copy Info > Copy Full Path or Copy Platform Style Path.
- 3 Paste the path.

Edit original artwork

The Edit Original command lets you open most graphics in the application in which you created them so that you can modify them as necessary. Once you save the original file, the document in which you linked it is updated with the new version.

Note: In InDesign, if you check out and select a managed graphics frame (one that has been exported to InCopy), rather than the graphic itself, the graphic opens in InCopy.

Edit original artwork using the default application

By default, InCopy relies on the operating system to determine which application is used when opening the original.

- 1 Select one or more images on the page or in the Links panel.
- 2 Do any of the following:
 - In the Links panel, click the Edit Original button .
 - Choose Edit > Edit Original.
- 3 After making changes in the original application, save the file.

Edit original artwork using a different application

- 1 Select the image.
- 2 Choose Edit > Edit With, and then specify the application you want to use to open the file. If the application does not appear, choose Other, and browse to locate the application.

Control layer visibility in imported images

When you import Photoshop PSD files, layered PDFs, and INDD files, you can control the visibility of top-level layers. Adjusting layer visibility in InCopy lets you vary an illustration depending on context. For example, in a multilanguage publication, you can create a single illustration that includes one text layer for each language.

You can adjust layer visibility either when you place a file or by using the Object Layer Options dialog box. In addition, if the Photoshop file contains layer comps, you can display the desired comp.

Set layer visibility

- 1 Do one of the following:
 - To import a graphic without first creating a frame, make sure that nothing in the document is selected.
 - To import a graphic into an existing frame, select the frame.
 - To replace an existing image, select the graphics frame.
- 2 Choose File > Place and select a graphics file.
- 3 To replace a selected object, select Replace Selected Item.
- 4 Select Show Import Options, and then click Open.
- 5 In the Image Import Options or Place dialog box, click the Layers tab.
- 6 To view a preview of the image, click Show Preview.
- 7 (PDFs only) If you're placing a page from a multipage PDF, click the arrows, or type a page number under the preview image to preview a specific page.
- 8 (Photoshop PSD files only) If the image contains layer comps, choose the layer comp you want to display from the Layer Comp pop-up menu.
- 9 Do one of the following:
 - To open or close a layer set, click the triangle to the left of the folder icon.
 - To hide a layer or layer set, click the eye icon next to the layer or layer set.
 - To display the layer or layer set, click the empty eye column next to the layer or layer set.
 - To display only the content of a particular layer or layer set, Alt-click (Windows) or Option-click (macOS) its eye icon. Alt-click or Option-click the eye icon again to restore the original visibility settings of the other layers.
 - To change the visibility of multiple items, drag through the eye column.
- 10 Set the When Updating Link option as desired:
 - Use Photoshop's/PDF's Layer Visibility** Matches the layer visibility settings to those of the linked file when you update the link.
 - Keep Layer Visibility Overrides** Maintains the layer visibility settings as they were when the file was originally placed.
- 11 Click OK.
- 12 Click OK, and do one of the following:
 - To import into a new frame, click the loaded graphics icon  in the layout at the place where you want the upper left corner of the graphic to appear.
 - To import into an existing, unselected frame, click the loaded graphics icon anywhere in that frame.
 - To import into an existing selected frame, you don't need to do anything. The image automatically appears in that frame.

 If you accidentally replace an existing graphic with an image you're placing, press **Ctrl+Z** (Windows) or **Command+Z** (macOS) to return the original image to the frame and display the loaded graphics icon.

Set layer visibility for placed AI, PSD, PDF, and INDD files

After you place a Photoshop PSD or layered PDF, an Illustrator AI file, or an InDesign INDD file, you can control the visibility of its layers by using the Object Layer Options dialog box. If the Photoshop PSD file contains layer comps, you can choose which comp you want to display. In addition, you can choose whether to maintain the visibility settings or match the settings of the original file each time you update the link.

- 1 Select the file in the InCopy document.
- 2 Choose **Object > Object Layer Options**.
- 3 To view a preview of the image, select **Preview**.
- 4 (Photoshop PSD files only) If the image contains layer comps, choose the layer comp you want to display from the Layer Comp pop-up menu.
- 5 Do one of the following:
 - To open or close a layer set, click the triangle to the left of the folder icon.
 - To hide a layer or layer set, click the eye icon next to the layer or layer set.
 - To display the layer or layer set, click the empty eye column next to the layer or layer set.
 - To display only the content of a particular layer or layer set, **Alt-click** (Windows) or **Option-click** (macOS) its eye icon. **Alt-click** or **Option-click** the eye icon again to restore the original visibility settings of the other layers.
 - To change the visibility of multiple items, drag through the eye column.
- 6 Set the Updating Link Options as desired:
 - Use Layer Visibility** Matches the layer visibility settings to those of the linked file when you update the link.
 - Keep Layer Visibility Overrides** Maintains the layer visibility settings as they were when the file was originally placed.
- 7 Click **OK**.

Importing InDesign (.indd) pages

Using the **Place** command, you can import pages from one InDesign document into another. You can import a page, a page range, or all of the pages in the document. The pages are imported as objects (much the same way that PDFs are imported).

Add pages in your document to hold the pages you want to import. After you choose **File > Place** and select an INDD file, you can choose **Show Import Options** and then choose which pages to import, which layers to make visible, and how to crop the imported pages. You can scroll in the Preview window to examine the thumbnail pages closely. The page or pages you select are loaded in the graphics icon. If you place multiple pages, InCopy loads the graphics icon with the following page so you can import pages one after the other.

Note: The **Links** panel lists the names of each page you imported. If a page you imported contains a graphic or other item that was imported into it, this item is listed as well in the **Links** panel. The names of these secondary imported items are listed under a disclosure triangle in the **Links** panel to distinguish them from imported pages.

Including metadata in a story

Work with metadata

Metadata is a set of standardized information about a file, such as author name, resolution, color space, copyright, and keywords applied to it. You can use metadata to streamline your workflow and organize your files.

About the XMP standard

Metadata information is stored using the Extensible Metadata Platform (XMP) standard, on which Adobe Bridge, Adobe Illustrator, Adobe InDesign, and Adobe Photoshop are built. XMP is built on XML, and in most cases the metadata is stored in the file. If it isn't possible to store the information in the file, metadata is stored in a separate file called a *sidecar file*. XMP facilitates the exchange of metadata between Adobe applications and across publishing workflows. For example, you can save metadata from one file as a template, and then import the metadata into other files.

Metadata that is stored in other formats, such as Exif, IPTC (IIM), GPS, and TIFF, is synchronized and described with XMP so that it can be more easily viewed and managed. Other applications and features also use XMP to communicate and store information such as version comments, which you can search using Adobe Bridge.

In most cases the metadata remains with the file even when the file format changes, for example, from PSD to JPG. Metadata is also retained when files are placed in an Adobe document or project.

You can use the XMP Software Development Kit to customize the creation, processing, and interchange of metadata. For example, you can use the XMP SDK to add fields to the File Infodialog box. For more information on XMP and the XMP SDK, visit the Adobe website.

Working with metadata in Adobe Bridge and Adobe Creative Cloud components

Many of the powerful Adobe Bridge features that allow you to organize, search, and keep track of your files and versions depend on XMP metadata in your files. Adobe Bridge provides two ways of working with metadata: through the Metadata panel and through the File Infodialog box (InDesign) or the Content File Info dialog box (InCopy).

In some cases, multiple views exist for the same metadata property. For example, a property may be labeled Author in one view and Creator in another, but both refer to the same underlying property. Even if you customize these views for specific workflows, they remain standardized through XMP.

Add metadata using the File Info dialog box

The File Info dialog box displays camera data, file properties, an edit history, copyright, and author information of the current document. The File Info dialog box also displays custom metadata panels. You can add metadata directly in the File Information dialog box. Any information you enter in a field overrides existing metadata and applies the new value to all selected files.

- 1 Choose File > File Info (InDesign) or File > Content File Info (InCopy).
- 2 Select any of the following from the tabs at the top of the dialog box:

Use the Right and Left arrows to scroll the tabs, or click the down-pointing arrow and choose a category from the list.

Description Lets you enter document information about the file, such as document title, author, description, and keywords that can be used to search for the document. To specify copyright information, select Copyrighted from the Copyright Status pop-up menu. Then enter the copyright owner, notice text, and the URL of the person or company holding the copyright.

IPTC Includes four areas: IPTC Content describes the visual content of the image. IPTC Contact lists the contact information for the photographer. IPTC Image lists descriptive information for the image. IPTC Status lists workflow and copyright information.

Camera Data Includes two areas: Camera Data 1 displays read-only information about the camera and settings used to take the photo, such as make, model, shutter speed, and f-stop. Camera Data 2 lists read-only file information about the photo, including pixel dimensions and resolution

Video Data Lists information about the video file, including video frame width and height, and lets you enter information such as tape name and scene name.

Audio Data Lets you enter information about the audio file, including the title, artist, bit rate, and loop settings.

Mobile SWF Lists information about mobile media files, including title, author, description, and content type.

Categories Lets you enter information based on Associated Presscategories.

Origin Lets you enter file information that is useful for news outlets, including when and where the file was created, transmission information, special instructions, and headline information.

DICOM Lists patient, study, series, and equipment information for DICOM images.

History Displays Adobe Photoshop history log information for images saved with Photoshop. The History tab appears only if Adobe Photoshop is installed.

Illustrator Lets you apply a document profile for print, web, or mobile output.

Advanced Displays fields and structures for storing metadata by using namespaces and properties, such as file format and XMP, Exif, and PDF properties.

Raw Data Displays XMP text information about the file.

- 3 Type the information to add in any displayed field.
- 4 Click OK to apply the changes.

Export metadata as an XMP file

You can save metadata in an XMP file to share with other users. These XMP files can be used as templates for populating InCopy documents and other documents created with XMP-enabled applications. Templates you export are stored in a shared location that all XMP-enabled applications can access. They also appear in the pop-up menu at the bottom of the File Info dialog box.

- 1 Choose File >File Info (InDesign) or File > Content File Info (InCopy).

InCopy documents

- 2 Choose Export from the pop-up menu at the bottom of the dialog box.
- 3 Type a filename, choose a location for the file, and click Save.

 *To view metadata templates in Explorer (Windows) or the Finder (macOS), click the pop-up menu at the bottom of the File Info dialog box and choose Show Templates Folder.*

Import metadata from an XMP file

When you import metadata into a document from an exported XMP template file, you can specify whether to clear all metadata in the current document and add the new metadata, keep all but the matching metadata, or add matching metadata to the existing metadata.

Choose File >File Info (InDesign) or File > Content File Info (InCopy).

- Choose an XMP file from the pop-up menu at the bottom of the dialog box, select an import option, and click OK.
- Choose Import from the pop-up menu at the bottom of the dialog box, select an import option, and click OK. Then double-click the XMP template file you want to import.

Edit metadata in image files

When you generate captions of placed images in InDesign, the metadata from the placed image is used. Although you can edit the metadata of InDesign documents, you cannot edit the metadata of placed files in InDesign. Instead, change the metadata of placed images using their original applications, using Finder or Explorer, or using Adobe Bridge or Adobe Mini Bridge.

- 1 In InDesign, right-click (Windows) or Control-click (macOS) the image, and then choose Edit Original.
You can also choose Edit With and then choose an application such as Adobe Illustrator or Adobe Photoshop.
- 2 In the original application, choose File > File Info.
- 3 Edit the metadata, and then click OK.

You can also select an image in Adobe Bridge and choose File > File Info to edit the image metadata.

Controlling graphics display

Control graphics' display performance

You can control the resolution of graphics placed in your document. You can change the display settings for the entire document or for individual graphics. You can also change a setting that either allows or overrides the display settings for individual documents.

Change a document's display performance

A document always opens using the default Display Performance preferences. You can change the display performance of a document while it is open, but the setting won't be saved with the document.

InCopy documents

If you've set the display performance of any images separately, you can override the settings so all objects use the same settings.

- 1 Choose View > Layout View.
- 2 Choose View > Display Performance, and select an option from the submenu.
- 3 To force objects that you have set individually to display using the document setting, deselect View > Display Performance > Allow Object-Level Display Settings. (A check mark indicates it is selected.)

Change an object's display performance

- 1 Choose View > Layout View.
- 2 To preserve the display performance for individual objects when the document is closed and reopened, make sure Preserve Object-Level Display Settings is selected in Display Performance preferences.
- 3 Choose View > Display Performance, and make sure Allow Object-Level Display Settings is selected.
- 4 With the Selection tool  or Direct Selection tool , select an imported graphic.
- 5 Select an imported graphic using the Position tool .
- 6 Do one of the following:
 - Select Object > Display Performance, and choose a display setting.
 - Right-click (Windows) or Control-click (macOS) the image, and choose a display setting from the Display Performance submenu.

 *To remove an object's local display setting, choose Use View Setting in the Display Performance submenu. To remove local display settings for all graphics in the document, select Clear Object-Level Display Settings in the View > Display Performance submenu.*

Display performance options

These options control how graphics are displayed on the screen, but they do not affect the print quality or exported output.

Use Display Performance preferences to set the default option used to open all documents, and customize the settings that define those options. Each display option has separate settings for displaying raster images, vector graphics, and transparencies.

Fast Draws a raster image or vector graphic as a gray box (default). Use this option when you want to quickly page through spreads that have lots of images or transparency effects.

Typical Draws a low-resolution proxy image (default) appropriate for identifying and positioning an image or vector graphic. Typical is the default option, and is the fastest way to display an identifiable image.

High Quality Draws a raster image or vector graphic at High Resolution (default). This option provides the highest quality but the slowest performance. Use this option when you want to fine-tune an image.

Note: *Image display options don't affect output resolution when exporting or printing images within a document. When printing to a PostScript device, exporting to XHTML, or exporting to EPS or PDF, the final image resolution depends on the output options you choose when you print or export the file.*

Set default display performance

The Display Performance preferences let you set the default display option, which InCopy uses for every document. You can change a document's display performance using the View menu, or change the setting for individual objects using the Object menu. For example, if you work on projects that contain numerous high-resolution photos (such as a catalog), you may prefer to have all your documents open quickly. You can set the default display option to Fast. When you want to see the images in more detail, you can switch the document view to Typical or High Quality (leaving the preference set to Fast).

You can also choose to view or override display settings applied to individual objects. If Preserve Object-Level Display Settings is selected, any settings applied to objects are saved with the document.

- 1 Select Edit > Preferences > Display Performance (Windows) or InCopy > Preferences > Display Performance (macOS).
- 2 For Default View, select Typical, Fast, or High Quality. The display option you choose applies to all documents you open or create.
- 3 Do one of the following:
 - To save display settings applied to individual objects, select Preserve Object-Level Display Settings.
 - To display all graphics using the default display option, deselect Preserve Object-Level Display Settings.
- 4 For Adjust View Settings, choose the display option you want to customize, and then move the slider for Raster Images or Vector Graphics to the desired setting.
- 5 Click OK.

Each display option has separate settings for raster (bitmap) images, vector graphics, and transparency effects.

Customize the display performance options

You can customize the definitions of each display performance option (Fast, Typical, and High Quality). Each display option has separate settings for raster (bitmap) images, vector graphics, and transparency effects.

Managed (linked) InCopy stories include low-resolution proxy data for images so that the full-resolution image doesn't have to be downloaded from the server whenever the file is checked out.

- 1 Select Edit > Preferences > Display Performance (Windows) or InCopy > Preferences > Display Performance (macOS).
- 2 For Adjust View Settings, choose the display option you want to customize.
- 3 For each display option, move the slider for Raster Images or Vector Graphics to the desired setting:
 - Gray Out** Draws an image as a gray box.
 - Proxy** Draws images at proxy resolution (72 dpi).
 - High Resolution** Draws images at the maximum resolution supported by the monitor and current view settings.
- 4 For each display option, move the slider for Transparency to the desired setting:
 - Off** Displays no transparency effects.
 - Low Quality** Displays basic transparency (opacity and blend modes), and transparency effects (drop shadow and feather) are shown in a low-resolution approximation.

InCopy documents

Note: In this mode, page contents are not isolated from the background; therefore, objects with blend modes other than Normal might appear different in other applications and final output.

Medium Quality Displays low-resolution drop shadows and feathers. This mode is recommended for most work unless the document is particularly transparency-heavy, or has many transparency effects.

High Quality Displays higher-resolution (144 dpi) drop shadows and feathers, CMYK mattes, and spread isolation.

Note: When a document's blending space is CMYK and you have either enabled the overprint preview mode or soft proofing, opacity matting is done in CMYK rather than RGB. This means that partially transparent CMYK colors display as tinted CMYK colors.

- 5 To view anti-aliasing for text, stroke, fill, and other page items, choose Enable Anti-aliasing. If text is converted to outlines, then the resulting outlines can be anti-aliased (macOS only).
- 6 To set the point size below which text displays as a dimmed bar, type a value for Greek Type Below.
- 7 Click OK.

To reset all controls back to the original default settings, click Use Defaults.

Frame grids

About frame grids in InCopy documents

When you create a new document in InCopy, you can decide whether the text area will contain a frame grid or plain text frame. A *frame grid* includes a set of squares into which Japanese characters appear. Frame grids are essentially the same as plain text frames in function and appearance except that they contain grids that can affect the appearance of text.

Frame grids have the following characteristics:

- Frame grids contain character attribute settings. These preset character attributes are applied to placed text. Plain text frames, meanwhile, do not have character attribute settings. When text is placed, it takes on the character attributes currently selected in the Character panel.
- Frame grid character attributes can be changed using File > Document Setup. Because plain text frames have no character attributes, you will need to select some placed text and set attributes using the Character panel. You can also select text placed in a frame grid and use the Character panel to change the character attributes.
- The grid of the frame grid is determined by the grid attributes (text direction, vertical and horizontal percentage, character aki, and line aki). You cannot change the color of a frame grid in InCopy.
- When you place the InCopy document into an existing InDesign frame grid or text frame, the InDesign settings are used to format the text. If you click the loaded text icon while placing the InCopy document, the InCopy document maintains the text area setting defined in InCopy.
- Unlike InDesign, InCopy does not have a layout grid or named grids.
- Frame grids appear only in Layout View when Show Frame Grid is selected. Show Frame Grid is turned on by default.

Document setup options for frame grids

When Frame Grid is selected for Text Area in the New Document or Document Setup dialog box, the following options are available:

Vertical and Horizontal Grid Scaling Specify the grid scaling for full-width Japanese characters in percentage.

Char Aki Specify the spacing between characters. This value is used for the grid mesh spacing.

Line Aki Enter a value to specify the grid line spacing. The value used here is the distance between the bottom (or left) edge of the character embox for the first line to the top (or right) edge of the character embox for the next line.

View frame grids

Frame grids are shown by default.

- 1 Choose View > Layout View.
- 2 Choose View > Grids & Guides > Show Frame Grid.

If the frame grid still does not appear, choose File > Document Setup, and make sure that Frame Grid is selected from the Work Area menu.

Convert text frames and frame grids

In stand-alone documents, you can convert plain text frames into grid frames or frame grids into text frames. When plain text frames are converted into frame grids, for text that has not had a character style or paragraph style applied in the story, the frame grid's document defaults are applied.

You cannot apply grid format directly to documents that don't have frame grids. After converting the text area into a frame grid, you can apply grid format attributes by applying a predetermined grid format to a frame grid using text that has not been given a paragraph style.

***Note:** Since character attributes are not set for text frames, changing a frame grid with character attributes into a plain text frame may cause reformatting. For example, when a frame grid with Character Aki set to -1H is converted into a plain text frame, character spacing becomes 0H, and the characters will be slightly spread out. Since the frame grid settings are preserved, converting back to a frame grid will display character spacing at the original value of -1H.*

Convert a text frame into a frame grid

- 1 Choose File > Document Setup.

The Document Setup option is dimmed if you're working with content that is linked to InDesign. For linked content, change the settings in InDesign.

- 2 From the Text Area menu, choose Frame Grid.
- 3 Specify the frame grid attributes.
- 4 Click OK.

To reformat the text according to grid attributes, select the text, and choose Edit > Apply Grid Format.

Convert a frame grid to a plain text frame

- 1 Choose File > Document Setup.

The Document Setup option is dimmed if you're working with content that is linked to InDesign. For linked content, change the settings in InDesign.

- 2 From the Text Area menu, choose Text Frame. Click OK.

Frames, grids, rulers, and guides

About frames in InCopy files

As in Adobe InDesign, all InCopy text and graphics appear inside frames. For linked documents, InDesign controls the frame placement and design for a publication. You can see the frame structure of the InDesign document in InCopy Layout view.

Modifying frames

You (or someone on your team) must make any changes to frames from within the InDesign document, unless the frames are for inline graphics. You can move, scale, rotate, or shear inline graphics frames, but not other frames. For more information, see your workflow documentation.

Threading text

A long story can flow from one frame to other frames that are connected in sequence, or *threaded*. A threaded story begins on a particular column of a page and can continue on any other columns and pages of the publication. The InDesign user always sets up the threading sequence for an InCopy story.

When you add text to a threaded story, the story flows through each successive frame until all of the assigned frames are full.

If the text doesn't fit in its allotted frame space, the hidden part of the story is called *overset text*.

Change measurement units and rulers

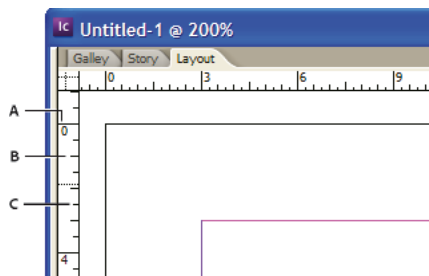

InCopy includes a vertical depth ruler for copyfitting text in Galley and Story views, as well as horizontal and vertical rulers in Layout view for measuring layouts. By default, rulers begin measuring from the upper-left corner of a page or spread. You can change this by moving the zero point.

You can work with several standard measurement units, change these settings at any time, and temporarily override the current measurement units as you enter a value. Changing the measurement units doesn't move guides, grids, and objects, so when ruler tick marks change, they might not line up with objects aligned to the old tick marks.

InCopy documents

You can set up different measurement systems for horizontal and vertical rulers. For example, many newspapers measure horizontal layouts in picas and vertical text stories in inches. The system you select for the horizontal ruler governs tabs, margins, indents, and other measurements. Each spread has its own vertical ruler; however, all vertical rulers use the same settings you specify in the Units & Increments section of the Preferences dialog box.

The default unit of measure for the rulers is picas (a pica equals 12 points). You can change the ruler units and control where the major tick marks appear on a ruler. For example, if you change the ruler unit for the vertical ruler to 12 points, a major ruler increment appears every 12 points (if such a display is possible in the current magnification). The tick mark labels include your customized major tick marks, so when the ruler reads 3 in the same example, it marks the third instance of the 12-point increment, or 36 points.

A Labeled tick marks B Major tick marks C Minor tick marks

 Setting custom ruler increments in the vertical ruler is useful for lining up a ruler's major tick marks with a baseline grid.

Specify the measurement units

You can set custom measurement units for the on-screen rulers and for use in panels and dialog boxes. You can also change these settings at any time and temporarily override the current measurement units as you enter a value.

- 1 Choose Edit > Preferences > Units & Increments (Windows) or InCopy > Preferences > Units & Increments (macOS).
- 2 For Horizontal and Vertical, choose the measurement system you want to use for horizontal and vertical dimensions in rulers, dialog boxes, and panels; choose Custom, and type the number of points at which you want the ruler to display major tick marks. Click OK.

 You can also change ruler units by right-clicking (Windows) or Control-clicking (macOS) a ruler, and choosing the units from the context menu.

Override default measurement units

You can specify a unit of measurement that is different from the default.

Highlight the existing value in a panel or dialog box, and type the new value using the notation in the following table:

To specify:	Type these letters after the value:	Examples	Result
Q	q	6q	6 Q
Ha	h	6h	6 Ha
Inches	i in inch "	5.25i 5.25in 5.25inch 5.25"	5 1/4 inches
Millimeters	mm	48mm	48 millimeters
Centimeters	cm	12cm	12 centimeters
Picas	p	3p	3 picas
Points	pt p (before value)	6pt p6	6 points
American points	ap	6ap	6 American points
Picas and points	p (between values)	3p6	3 picas, 6 points
Pixels	px	5px	5 pixels
Ciceros	c	5c	5 ciceros
Agates	ag	5ag	agates

Japanese measurement units

Q and Ha are units used in a Japanese manual or automatic photo composer to show font size, tracking or leading length. Each unit has a value of 0.25mm. Q is used only to express font size, Ha can be used to express direction and length for leading, object spacing and similar elements.

You can also use points (also known as American points) to indicate font size on computers, or Adobe PostScript® points to indicate leading or spacing. One American point is 0.35146 millimeters, and there are 72.27 American points in 1 inch and 72 PostScript points in 1 inch.

Change the zero point

The *zero point* is the position at which the zeros on the horizontal and vertical rulers intersect. By default, the zero point is at the top left corner of the first page of each spread. This means that the default position of the zero point is always the same relative to a spread, but may seem to vary relative to the pasteboard.

The X and Y position coordinates in the Control panel, Info panel, and Transform panel are displayed relative to the zero point. You can move the zero point to measure distances, to create a new reference point for measurement, or to tile oversized pages. By default, each spread has one zero point at the upper left corner of the first page, but you can also locate it at the binding spine, or specify that each page in a spread has its own zero point.

Adjust the zero point

When you move the zero point, it moves to the same relative location in all spreads. For example, if you move the zero point to the top left corner of the second page of a page spread, it will appear in that position on the second page of all other spreads in the document.

Do one of the following:

- To move the zero point, drag from the intersection of the horizontal and vertical rulers to the position on the layout where you want to set the zero point.

- To reset the zero point, double-click the intersection of the horizontal and vertical rulers.
- To lock or unlock the zero point, right-click (Windows) or Control-click (macOS) the zero point of the rulers, and choose Lock Zero Point in the context menu.

Change the default zero point

Using the Origin setting in the Preferences dialog box, you can set the default zero point for rulers as well as the scope of the horizontal ruler. The *scope* determines whether the ruler measures across the page, across the entire spread, or, for multipage spreads, from the center of the spine.

If you set the ruler origin at each spread's binding spine, the origin becomes locked at the spine. You won't be able to reposition the ruler origin by dragging it from the intersection of the rulers unless you choose another origin option.

1 Choose Edit > Preferences > Units & Increments (Windows) or InCopy > Preferences > Units & Increments (macOS).

2 In the Ruler Units section, in the Origin menu, do one of the following:

- To set the ruler origin at the top-left corner of each spread, choose Spread. The horizontal ruler measures across the entire spread.
- To set the ruler origin at the top-left corner of each page, choose Page. The horizontal ruler starts at zero for each page in a spread.
- To set the ruler origin at the center of the spine, choose Spine. The horizontal ruler measures in negative numbers to the left of the spine and positive numbers to the right of the spine.

 You can also change horizontal ruler origin settings using the context menu that appears when you right-click (Windows) or Control-click (macOS) the horizontal ruler.

Use grids

In Layout view, you can view (or hide) a framework of grids and guides to show the position and alignment of objects. In most work systems, a designer working with InDesign sets up the grids and guides for the publication. InCopy users can see these layout aids after an InCopy story is linked to the InDesign document.

You can create grids within InCopy. But, because InDesign grids override InCopy settings when files are linked, this feature is more useful for stand-alone documents that you publish directly from InCopy.

These grids and guides are never visible on printed or exported output. One set of rulers and grids exists per page, but a guide can exist across all pages of a spread or within only a single page.

Note: Grids, rulers, and guides are not available in Galley or Story view.

Set up a baseline grid

Use Grid Preferences to set up a baseline grid for the entire document.

You can set up a baseline grid for a frame by using the Text Frame Options.

- 1 Choose Edit > Preferences > Grids (Windows) or InCopy > Preferences > Grids (macOS).
- 2 Specify a baseline grid color by choosing a color in the Color menu. You can also choose Custom in the Color menu.
- 3 For Relative To, specify whether you want the grid to start at the top of the page or the top margin.
- 4 For Start, type a value to offset the grid from either the top of the page or the top margin of the page, depending on the option you choose from the Relative To menu. If you have trouble aligning the vertical ruler to this grid, try starting with a value of zero.
- 5 For Increment Every, type a value for the spacing between grid lines. In most cases, type a value that equals your body text leading, so that lines of text align perfectly to this grid.

A First grid line B Increment between grid lines

- 6 For View Threshold, type a value to specify the magnification below which the grid does not appear. Increase the view threshold to prevent crowded grid lines at lower magnifications.

- 7 Click OK.

Note: The Snap To Guides command controls both snapping to guides and snapping to the baseline grid.

Set up a document grid

- 1 Choose Edit > Preferences > Grids (Windows) or InCopy > Preferences > Grids (macOS).
- 2 Specify a document grid color by choosing a color in the Color menu. You can also choose Custom in the Color menu.

InCopy documents

- 3 To set horizontal grid spacing, specify a value for Gridline Every in the Horizontal section of the Document Grid section, and then specify a value for Subdivisions between each grid line.
- 4 To set vertical grid spacing, specify a value for Gridline Every in the Vertical section of the Document Grid section, and then specify a value for Subdivisions between each grid line.
- 5 Do one of the following, and click OK:
 - To put the document and baseline grids behind all other objects, make sure that Grids In Back is selected.
 - To put the document and baseline grids in front of all other objects, deselect Grids In Back.

 To put guides behind all other objects, you can also choose *Guides In Back* in the context menu that appears when you right-click (Windows) or Control-click (macOS) an empty area of the document window.

Show or hide grids

- To show or hide the baseline grid, choose View > Grids & Guides > Show/Hide Baseline Grid.
- To show or hide the document grid, choose View > Grids & Guides > Show/Hide Document Grid.
- To show or hide the layout grid, choose View > Grids & Guides > Show/Hide Layout Grid.
- To show or hide frame grids, choose View > Grids & Guides > Show/Hide Frame Grid.

View ruler guides

Ruler guides are different from grids in that they can be positioned freely on a page or on a pasteboard. InDesign users can create two kinds of ruler guides: *pageguides*, which appear only on the page on which they create them, or *spreadguides*, which span all pages and the pasteboard of a multiple-page spread. You can view ruler guides if they exist in the InDesign document or assignment file, but you cannot create them in InCopy.

A Spread guide B Page guide

Show or hide ruler guides

- 1 Make sure that you are in Layout view; if necessary, click the Layout view tab at the top of the edit pane.
- 2 Choose View > Grids & Guides > Show/Hide Guides.

Display ruler guides behind objects

By default, ruler guides appear in front of all other guides and objects. However, some ruler guides may block your view of objects, such as lines with narrow stroke widths.

You can change the Guides In Back preference to display ruler guides in front of or behind all other objects. However, regardless of the Guides In Back setting, objects and ruler guides are always in front of margin and column guides.

- 1 Choose Edit > Preferences > Guides & Pasteboard (Windows) or InCopy > Preferences > Guides & Pasteboard (macOS).
- 2 Select Guides In Back, and click OK.

Customize the pasteboard and guides

- 1 In the Edit menu (Windows) or InCopy menu (macOS), choose Preferences > Guides & Pasteboard.
- 2 To change the color of margin or column guides, choose a preset color from a menu, or choose Custom and specify a color using the color picker.
- 3 To make the pasteboard bigger or smaller, enter a value for Minimum Vertical Offset. Click OK.

Use layers

Layers are like transparent sheets stacked on top of each other. If a layer doesn't have objects on it, you can see through it to any objects on layers behind it.

Only InDesign users can create layers. InCopy users can show or hide layers, show or hide objects on layers, and change layers settings. If the InDesign user created multiple layers in the document, you can hide layers in InCopy, letting you edit specific areas or kinds of content in the document without affecting other areas or kinds of content. For example, if your document prints slowly because it contains many large graphics, you can hide all non-text layers and quickly print the text layer for proofreading.

Additional layer notes:

- Objects on masters appear at the bottom of each layer. Master objects can appear in front of document page objects if the master page objects are on a higher layer.
- Layers involve all pages of a document, including masters. For example, if you hide Layer 1 while editing page 1 of your document, the layer is hidden on all pages until you decide to show it again.

Show and hide layers

- 1 Choose Window > Layers.
- 2 In the Layers panel, do any of the following:
 - To hide a specific layer, click the eye icon to the left of the layer name.
 - To show a specific layer, click the space to the left of the layer name.
 - Click a triangle next to a layer name to display the layer objects. Click the eye icon to show or hide individual objects.
 - To show or hide all layers at once, choose Show/Hide All Layers from the panel menu. Note: Only visible layers and objects print.

Chapter 4: InCopy and InDesign

Sharing content

Exporting content from InDesign

Exporting content from InDesign to InCopy establishes a link between the two applications. You export InDesign text frames, graphics frames, and their contents to InCopy using either of two methods:

- Create a container file (*.icma)—called an *assignment*—and add related groupings of document items (such as the text and graphics of a story) to the assignment so they can be worked on together. Content within assignments is exported as *.icml files.
- Export text and graphics frames separately (including placeholder frames) using the Edit > InCopy > Export menu commands. Exported content is saved as *.icml files.

After content is exported, small icons appear at the top left of exported frames in InDesign and InCopy, and in the Assignments panel. A link to the exported file appears in the Links panel. These icons indicate the status of managed frames and they differentiate managed frames from those that aren't part of the workflow. All exported content appears in the Assignments panel. Content exported using the Export menu commands appears in the Unassigned InCopy Content section of the Assignments panel list. While both methods establish a controlled connection between InCopy content and an InDesign document, the primary method is to use assignment files.

Exporting content makes the content available for users to check out while maintaining a link to the original InDesign document. (This link is made from within InDesign; you cannot create the link from InCopy.)

Once the content is exported, InCopy users can see (but not change) the page layouts, styles, and so forth as they appear in the InDesign document.

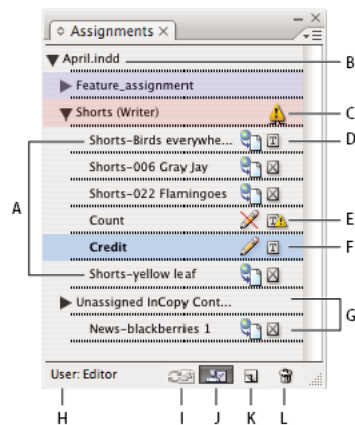

Note: You can also create text or anchored graphics using InCopy and then place them in InDesign.

Assignments panel overview

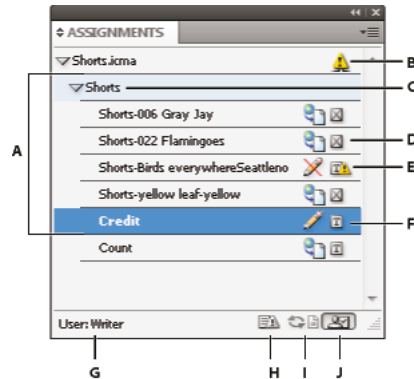

The primary tool for working with assignments is the Assignments panel (Window > Assignments in InCopy, Window > Editorial > Assignments in InDesign). The Assignments panel displays the files exported from the currently active InDesign document, and an icon indicates their status. The Assignments panel menu also contains commands that control import version and file-management functions between InCopy and InDesign. When you open an assignment in InCopy, the assignment name and its contents appear in the Assignments panel. You can double-click text and graphics frames in the Assignments panel to select them in the document window.

Note: All content exported to InCopy or added to an assignment is also listed in the Links panel. Although you can do some workflow management tasks, such as checking out and checking in content, the recommended panel for these tasks is the Assignments panel.

InCopy and InDesign

A InCopy content names B Assignment Out Of Date status C Assignment name D Available And Text Up To Date status E In Use And Text Out Of Date status F Editing And Text Up To Date status G User name H Update Design button I Update Content button J Check Out/Check In Selection button

Assignment files

In InDesign, assignment files are containers for organizing collections of page items. For example, you might want to select all the items in a story (headline, byline, copy, graphics, and captions), and then assign them to one InCopy user. Adding those items to an assignment provides a convenient way for InCopy users to access only the content for which they are responsible. Assignment files (*.icma) appear in the file system, in the InCopy story bar, and in status messages. Only InDesign users can create assignment files; only InCopy users can open them.

When you create an assignment, a folder is created in the same location as the InDesign document by default. This assignment folder includes the *.icma assignment files and a content subfolder that contains any exported InCopy story files (in .icml format) that are part of images or other resources. Once the assignment is created, store the project folder in a location where all users have access to it, or create and distribute an assignment package. If content is exported before it's added to an assignment, the files on disk are not moved to the content folder of the assignment file.

Assignment files include the following:

- Links or pointers to the associated page items, including placeholder frames. These elements let the InCopy user open a single file in InCopy and have editorial access to multiple page items.
- Any transformations on the graphics included in the assignment, such as moving, scaling, rotating, or shearing.

InCopy and InDesign

- Page geometry, so InCopy users can see the layout of the frame and its content that they're editing without opening the entire InDesign file.
- Color-coding of assigned frames in the document.

Create assignments and add content (InDesign)

Only InDesign users can create assignments and add content to them. There are several ways to create assignments. The method you choose usually depends on whether you have content to add at the time you create the assignment.

- Create empty assignment files. From your InDesign document, you can create a series of empty assignments to act as templates for content to come later.
- Create assignments and add content at the same time.
- Add content to an existing assignment file. You can add linked content—text and graphics that have already been exported as InCopy content—or you can add selected page items to become linked InCopy content. If one or more of the selected frames already contain InCopy content files, and none is part of an assignment, you can add them to a new or existing assignment file.

By default, the assignment folder you create is saved in the same folder as the InDesign document. You can then place this folder on a server or create and send a package.

Note: If you don't want InCopy users to place and fit graphics, don't add graphics frames to an assignment.

Create empty assignment files (InDesign)

- 1 In InDesign, save the document.
- 2 In the Assignments panel, choose New Assignment from the panel menu.
- 3 In the New Assignment dialog box, specify assignment file options and click OK.

Simultaneously create assignments and add content (InDesign)

- 1 In InDesign, create a document that has one or more text frames, graphics frames, or placeholder items, and then save the document.
- 2 Select the text and graphics frames you want to add.
- 3 Do one of the following:
 - From the Assignments panel menu, choose Add To Assignment, and then select New.
 - Choose Edit > InCopy > Add [option] To Assignment > New.
- 4 In the New Assignment dialog box, specify assignment file options and click OK.

The newly created assignment file includes any frames selected in the document window.

Add content to existing assignments (InDesign)

- 1 Save the InDesign document.
 - 2 Select the text and graphics frames you want to add.
 - 3 Do one of the following:
 - From the Assignments panel menu, choose Add To Assignment, and then select the assignment.
 - Drag content from the Unassigned InCopy Content section of the Assignments panel into an existing assignment.
 - Select page items with the Selection tool and drag them to an existing Assignment in the Assignments panel.
 - Choose Edit > InCopy > Add [option] To Assignment, and then select the assignment.
 - 4 Choose Update All Assignments from the Assignments panel menu to make the content available to InCopy users.
- Note: You can add content only to assignments in the same document. However, you can import the same content into multiple documents and add it to an assignment in each of those documents.*

Assignment file options (InDesign)

When you create or modify an assignment file, you can set the following options:

Assignment Name The unique identification of the assignment in the Assignments panel, for example “Ocean article.” This name must conform to the file naming conventions of the operating system.

Assigned To The unique identification of the user assigned to the files. The user’s name appears in parentheses following the assignment name in the Assignments panel. Entering a name here is for informational purposes only; it doesn’t grant special rights or permissions to the user.

Color Displays a list of colors for adding a distinctive highlight to the frames of the current assignment in the document window, and to the assignment names in the Assignments panel. This color coding differentiates frames that belong to one assignment from frames that belong to another, and it differentiates from unassigned frames. To toggle the display of this color coding, choose View > Extras > Show/Hide Assigned Frames. In InCopy, the color coding is visible only in Layout view.

Note: If toggling the display of assigned frames produces unexpected results, those frames might be tagged for XML and View > Structure > Show Tagged Frames might be enabled. You cannot show assigned frames and tagged frames at the same time.

Change Click the Change button to specify the location of the assignments folder. By default, the assignments folder is created in the same location as the InDesign file.

Placeholder Frames Lets InCopy users see the text and graphics frames in the assignment as well as boxes (or other shapes) representing all other frames on those InDesign pages. All frames and placeholders accurately reflect the size, shape, and location of the InDesign originals. Placeholder frames are empty shapes that don’t show any of the content in the InDesign document. The Placeholder Frames option provides the least amount of fidelity, and therefore provides the fastest performance. In InCopy, the placeholder frames are visible only in Layout view. InCopy users cannot check out and edit placeholder frames.

Assigned Spreads Lets InCopy users see all assigned frames, as well as the entire contents of other frames that aren’t part of the assignment, on the same spread. In InCopy, content in frames outside an assignment isn’t editable and is visible only in Layout view.

All Spreads Exports all content in the InDesign document to the assignment file. This option provides the maximum amount of fidelity; it also provides the slowest performance because the assignment file displays the design and layout of every page, including pages not relevant to the section a user is editing.

Linked Image Files When Packaging Includes a copy of linked images in the assignment package. Selecting this option gives InCopy users access to images but increases the package's file size. InCopy users can include images while returning a package.

Export content as separate InCopy files (InDesign)

If your workgroup prefers working with separate files rather than using assignments, you can export InCopy content without using an assignments file. Compared with creating a single assignment file with references to multiple content files and layout information, this method creates a separate file (.icml) for each text or graphics frame you specify in the document. To see the context of the content you are editing, you must also open the associated InDesign document (.indd).

Cater the InDesign document to suit your workflow needs. For example, if you want all of the editor's comments to be exported in a single file, create a layer for the editor to make comments. You can then export all the content on the selected layer.

Note: A quick way to export content as separate InCopy files is to use the Selection tool to drag selected frames into the Unassigned InCopy Content in the Assignments panel.

1 In InDesign, create a document with one or more text frames, graphics frames, or placeholder items.

2 Do either of the following:

- Select the text or graphics frame of a single story, or Shift-click to select multiple frames.
- Click an insertion point in a story, or select some text in a text frame.

3 Choose Edit > InCopy > Export, and then choose one of the following options:

Selection Exports all selected text and graphics frames.

Layer Exports all content on the selected layer.

All Stories Exports every story that has not been exported already.

All Graphics Exports every graphic that has not been exported already.

All Graphics And Stories Exports every story and graphic that has not been exported already.

 *If you export all content in the document, and then add more text or graphics frames to the same document, you can save time exporting the new ones by using the Export > All Stories (or All Graphics or All Graphics And Stories) command again. InDesign exports only the new content.*

4 Enter a name and location for the files, and then click Save.

The file name you specify is used as a prefix for identifying each exported content file in the file system. If you export multiple text frames, the first several characters of the text are automatically appended to the file name; for example, "mystery-Upcoming cycling events.icml." For multiple graphics frames, the file names are formed as "mystery-graphic," "mystery-graphic-1," and so on. The file name appears in the file system, in the InCopy story bar, and in status messages.

5 When prompted, save your InDesign file.

The InCopy content is now managed, and is available to be checked out and edited by other users in the workflow.

Shared content appears in the Links panel just like imported graphics. If you move a shared file manually, you can use the Links panel to update its link.

 When you export content, you see the Available icon  on the text frame (InDesign and InCopy), and in the Assignments panel (InCopy). The word [Editing] appears in the story bar (InCopy).

Working with managed files

Open shared content

Only InCopy users can open assignment files (.inca). If an InCopy user opens an InDesign file that contains assignments, the user will have access to all the managed content, regardless of assignments.

Do one of the following.

- In InCopy, choose File > Open, select an assignment file (.icma or .inca), and click Open.
- In InDesign or InCopy, choose File > Open, select an InDesign file (.indd) that contains assigned content, and click Open.
- Open an assignment package.

The assignment names and their contents appear in the Assignments panel.

Check out content

When you check out an item, a hidden lock file (.idlk) is placed on the file system. Once the content is checked out, you have exclusive control over its content, and others are locked out from making changes. You can check out InCopy content only; you cannot check out InDesign documents with layout information.

If you attempt to close an InDesign document containing one or more InCopy content files that are checked out to you, an alert message appears, prompting you to check in all content. If you close the document without checking in the content files, they will still be checked out to you the next time you open the InDesign document. Saving the InDesign document automatically saves every editable InCopy content file.

Check out content (InDesign)

Do one of the following:

- In the layout, select the text or graphics frames to edit and choose Edit > InCopy > Check Out.
- In the Assignments panel, select the files and choose Check Out from the panel menu.

When you check out available content in InDesign, you see the Editing icon  on the InDesign frame. In InCopy, the In Use icon  appears on the InCopy frame and in the Assignments panel if the assignment files are stored on a local server.

Check out content (InCopy)

1 Do one of the following:

- If the content you want is part of an assignment, choose File > Open and select the assignment file (.icma or .inca).
- If the content you want was exported as individual files, choose File > Open and select the InCopy file (.icml or .incx). To see the layout so you can do copyfitting, select the InDesign document.

2 Do one of the following:

- To check out a single InCopy content file, choose File > Check Out.
- To check out all content in an assignment at once, select the assignment in the Assignments panel, and choose Check Out from the panel menu.
- To check out individual items in an assignment, open the assignments list in the Assignments panel, select an item or multiple items, and choose Check Out from the panel menu.

The Editing icon  appears next to the item or items in the Assignments panel, indicating that the content is checked out to you for your exclusive use.

3 If prompted to update the content with changes, click OK.

When you check out available content in InCopy, you see the Editing icon  on the InCopy frame, and in the Assignments panel. In InDesign, the In Use icon  appears on the InDesign frame.

Opening managed files (InCopy)

Opening a managed content file (.icml or .incx) directly in InCopy and working with it in Story view may be more appropriate for quick writing and editing. You do not have to check out an individual managed file to edit it; InCopy automatically checks it out. When you save and close the file, InCopy automatically checks in the content. The Save commands are different when you open individual files.

Update assignment files (InDesign)

You can save changes to assignments manually or when you close the current document. Updating an assignment file is the only way to make layout changes available to InCopy users.

Do one of the following:

- To update selected assignments, select them in the Assignments panel and choose Update Selected Assignments from the Assignments panel menu.
- To update all out-of-date assignments in the current document, choose Update Out-Of-Date Assignments from the Assignments panel menu. Only assignments that are out of date are updated.
- To update all assignments in the current document, choose Update All Assignments from the Assignments panel menu.

Note: If an InCopy user has an assignment open when you update the assignment, the Out Of Date icon  appears next to the assignment in the InCopy Assignments panel.

Update content

To make sure that you're always working on the most up-to-date content, be sure to watch for Out Of Date icons in the Assignments panel, and then update content accordingly. Updating an InCopy assignment file and its contents or updating individual content files copies data from the latest file system copy so that the version displayed on your computer matches the one on the file system. Updating does not require checking in or out and does not give you editing rights. However, updating can cause problems if another user has deleted your lock.

Note: *Updating content does not update content in assignment packages that have not been returned.*

A typical updating workflow is as follows:

- 1 The InCopy user opens an assignment file or checks out an individual content file and edits the content.
- 2 The InCopy user saves the content file, which updates the copy on the file system, and continues working.
- 3 The InDesign user sees the Out Of Date icon  in both the Assignments panel and the Links panel next to the selection, and the In Use  and Text Content Out Of Date icon  or Graphics Content Out Of Date icon  on the associated frame.

- 4 The InDesign user updates the content.

Update content while opening a managed document (InDesign)

- 1 Choose File > Open, locate the file you want to open, and click Open.
- 2 Click Yes when prompted to update the document with the modified content on the file system.
- 3 Do one of the following:
 - To let InDesign update the links, click Fix Links Automatically.
 - To fix links manually, click Don't Fix, and then, in the Links panel, select the file to update and choose Update Link from the panel menu.

Update content while working (InDesign)

Do one of the following:

- Select the text or graphics frames in the layout and choose Edit > InCopy > Update Content.
- Select the text or graphics frames in the Links panel, and click the Update Link button  or choose Update Link from the Assignments panel menu.

Update content while working (InCopy)

Do one of the following:

- Click an insertion point in the text frame to select it, and then choose File > Update Content.

- Select the content in the Assignments panel, and then click the Update Content button  or choose Update Content from the Assignments panel menu.

You can also update content using the Links panel.

Accidentally updating your work

In most cases, the update commands are disabled for content you have checked out, because that content would always be up to date. However, an undesirable situation can occur if a different user deletes the lock on checked-out content (by dragging the lock file [.idlk] to the Recycle Bin [Windows] or Trash [macOS]), and modifies the content. In this case, the update commands can become enabled even while the content is checked out to you, essentially allowing two people to edit the content at the same time. Updating the content results in lost work. For best results, do not delete the lock files.

Update the InDesign layout

InDesign users can modify the layout (for example, change the size or location of the text frames of a story) and save the changes while InCopy users are modifying the text of these text frames. In a shared server workflow, the way InCopy users are notified about layout changes depends on whether they have opened an assignment file or have checked out individual content files and also opened the linked InDesign file.

Consider the following:

- If an InDesign user changes the layout of frames in an assignment, the user must update the assignment to make the design changes available to InCopy users. InDesign does not automatically update assignment files when the document is saved.
- Once the InDesign user updates the assignment stored on a shared server, the Out Of Date icon  appears next to the assignment in the InCopy Assignments panel. The InCopy user must update the design to see the current layout.
- If an InDesign user changes the layout of exported content that is not part of an assignment, the Out Of Date icon appears next to the InDesign document name in the Assignments panel, and the document title bar indicates the layout is out-of-date. InCopy users can update the currently active InDesign document with the latest layout and style changes.

Updating the layout in InCopy is useful for copyfitting tasks, because the latest appearance and line breaks are visible in Layout and Galley views.

Do one of the following:

- If you have an assignment file open and the Assignments panel shows the Out Of Date icon  next to the assignment name, click the Update Design button , or choose File > Update Design. You cannot undo this command.
- If you are not working with assignment files and you have more than one InDesign document open, select the one you want to make active, and choose File > Update Design.

Check in content

When you check in a managed content file, you save it to a shared location on a file system where it can be checked out by others for editing or other changes. Exporting a text or graphics frame from InDesign also checks it in automatically.

Although a checked-in file is available for editing, it is not actually editable until it is checked out (unless you edit the content in stand-alone mode in InCopy). Checking in content relinquishes editing control, but does not close the file. The content remains open on your screen, but in a read-only state.

The LiveEdit Workflow plug-ins do not create multiple file versions. Instead, files are overwritten when updated in either InCopy or InDesign.

If you are working on an assignment package, return or forward the assignment package after checking it in.

Check in managed content (InDesign)

Do one of the following:

- Select the content in the layout and choose Edit > InCopy > Check In.
- In the Assignments panel, select the content and choose Check In from the panel menu.

Check in managed content (InCopy)

Do one of the following:

- Select the content in Layout view and choose File > Check In.
- In the Assignments panel, select the content and choose Check In from the panel menu.

Note: You can undo the most recent changes before you check in content.

 When you check in a file, the Available icon appears on the text or graphics frame in the InDesign layout, in the InCopy Layout view, in the Assignments panel, and in the story bar (InCopy).

Save changes (InDesign)

As you work on content you have checked out, you can save your changes and update the file-system copy. Do one of the following:

To save the selected content without saving changes to the InDesign document or any of its linked files, select the content in the layout and choose Edit > InCopy > Save Content.

- To save every content file checked out to you, choose File > Save. This type of save does not automatically update assignment files or checked-out content files in InCopy. However, the checked-out files in InCopy will show the Out Of Date icon  in the Assignments panel.
- To save the InDesign document under a new name with links to any existing InCopy files, choose File > Save As. This action causes the assignments in the InDesign file to appear as missing until they are updated.
- To save a copy of the currently active document, choose File > Save A Copy. You can choose to give the copy a new name and location with links to any existing InCopy files.

Save changes (InCopy)

Do one of the following:

- To save the InCopy file under the same name and location on the file system, choose File > Save Content. The file is still checked out to you.
- To save the InCopy content file under a new name, choose File > Save Content As. The newly created content file is not managed in the workflow. The Save Content As command is available only if you have opened the InCopy content file (.icml or .incx) directly.
- To save a copy of the currently active InCopy content file, choose File > Save Content Copy. You can choose to give the copy a new name and location. The saved copy is not managed in the workflow. The Save Content Copy command is available only if you have opened the InCopy content file (.icml or .incx) directly.

- To save all currently open and checked-out InCopy content files, choose File > Save All Content. This saves all files to their current locations. The Save All Content command is available only if you have opened an assignment or InDesign file.

Understanding a basic managed-file workflow

For detailed information and instructions, click the links below.

Sharing content

The Adobe InCopy LiveEdit Workflow plug-ins let writers and editors develop copy in InCopy at the same time as designers prepare layouts in Adobe InDesign. This workflow includes container files, called *assignments*, for grouping related pieces of content, and file-locking and notification tools for sharing and updating files in InCopy or InDesign over a shared network or in compressed packages that can be distributed via e-mail.

In the shared network workflow, InDesign users export text and graphics to a shared location on a file system, where the files become available to InCopy users who will write and edit the content. Selected text frames and graphics frames are either exported to the assignment or exported as separate InCopy files, where they become part of the managed process and are linked to the InDesign document. These shared files are referred to as *managed files*. When users work in the assignment file or in the InDesign file on a local server, changes to the associated layout or content are communicated to all users involved in the workflow for that document.

Multiple InCopy or InDesign users can open the same content file simultaneously, and multiple InCopy users can open the same assignment file simultaneously. However, only one user at a time can *check out* the InCopy file for editing. Others can view the file on a read-only basis. The user who checks out a managed InCopy file can share his or her work with other users by saving the file to the shared server or by returning the file to the InDesign user; however, other users can't make changes to the file until it's checked back in. This system allows multiple users to access the same file but prevents users from overwriting each other's work.

Ways to work with content in InCopy

Content is either a body of text that flows through one or more frames, or an imported graphic. There are five basic ways to work on content in InCopy: open an assignment file, open an assignment package, open a linked InCopy file, open an InDesign file that has linked InCopy files, or compose content entirely in InCopy.

Open assignment files created in InDesign

InDesign users can create an assignment file and designate content for sharing. This method lets the InDesign user associate related components (heading, body, graphics, captions, and so on), and then assign them to different InCopy users for writing and editing. InCopy users open the assignment file and work on only the components assigned to them. The live layout view shows how their edited copy relates to the InDesign layout, without opening the entire InDesign document. However, if the layout changes, the InDesign user must update assignments to notify InCopy users about the changes. You can share assignment files on a server or through assignment packages.

Open assignment packages

InCopy and InDesign

The assignment packages workflow is especially useful when designers and writers are working on the same project but don't have access to a local server. In such cases, the InDesign user can create one or more packages and send the compressed files to the assigned InCopy users via e-mail. InCopy users can open the assignment packages, edit the contents, and return the packages to the InDesign user, who can then update the document.

Open linked InCopy files exported from InDesign

In certain workflows, InDesign users might export text and graphics as separate files, rather than wrapping them inside an assignment file. Exporting separate files is useful if you work on unrelated graphics or bodies of text. However, InCopy users aren't able to see how the content fits within the InDesign layout.

Open InDesign documents that have linked InCopy files

To see all page items in the context of an entire layout, InCopy users can open and edit an InDesign document in InCopy. This approach can be useful for editing and copyfitting if seeing the overall layout is important, or for editing most of the stories in a document rather than a few. After the InCopy user edits the stories, the InDesign user can then update the links to the modified files. If the InDesign user changes the layout, the InCopy user is notified when the InDesign document is saved.

Compose content entirely in InCopy

You can create content in InCopy that isn't associated with an InDesign file. In these stand-alone documents, you can type text, assign fonts and styles, and import graphics from other applications (such as Adobe Illustrator and Adobe Photoshop) to enhance the text. You can also assign tags for future XML use. This approach is a good option in an editorial workflow where the content precedes the design. You can also set up and modify the text area, page size, and orientation for stand-alone InCopy documents. But if the story is later linked to an InDesign document, the InDesign settings override the settings used in InCopy.

Managed files

For a file to be managed, it must be added to an assignment file, exported from InDesign as InCopy content, or placed as InCopy content into InDesign. Managed files communicate both content status and ownership. With managed files, you can:

- Lock and unlock stories to help preserve file integrity.
- Notify InCopy users when the associated InDesign layout is outdated.
- Identify the user working on a file.
- Notify users when an InCopy content file is outdated, being used by someone, or available for editing. Notification methods include alert messages, frame icons, status icons in the Links panel, and status icons in the Assignments panel.

Read-only files

Once a content file becomes managed, it's *read-only* to all users in the workflow at all times, except to the person who has checked it out. The software creates a lock file (*.idlk) when a user checks out a content file, giving that user exclusive editing control. Read-only files have the following characteristics:

- An InCopy user cannot manually format the text in it. However, if text has been assigned character or paragraph styles, an InDesign user can change the definition of those styles, thereby changing the formatting of the text even when the file is checked out to someone else. These style definition changes are reflected in the text once the InDesign user updates the file.
- In general, neither an InCopy nor InDesign user can change objects, such as text and applied styles, in locked InCopy content. Some objects, such as character and paragraph styles, are only *used* by the content. For example, you can't change how a character style is applied to objects in locked content, but you can change the character style itself, thereby changing the appearance of the text.
- An InDesign user can change the margins and columns of the text content as well as the shape, location, and number of text frames the story occupies.
- An InDesign user can change the geometry and formatting of a graphics frame without checking out the graphic. An InCopy user cannot change a graphics frame or any formatting on the frame. However, both InDesign and InCopy users have to check out the graphics frame in order to modify the graphic itself (for example, to rotate or scale it).

Best practices for working with managed files

Use the following practices to make sure that you work with the most up-to-date content and don't overwrite someone else's work:

- Store assignment files on a server where all team members have access. If team members don't have access to a server, you can create and distribute assignment packages.

- When you create an assignment, a special folder is created to hold the assignment file and the content. Use these assignment folders to maintain assignment and content files. They simplify managing the shared files across a workgroup and help ensure that users open the correct files.
- In InCopy, open the assignment file instead of an individual InCopy story. That way, you can see the copyfit and layout information in Galley and Layout views. If you export content without using assignment files, you can see copyfit and layout information only by opening the InDesign file.
- As soon as you open an assignment file, open an InDesign document, or check out content in either InDesign or InCopy; make sure that frame edges are showing (View > Extras > Show Frame Edges) so that you can see the frame icons when they appear.
- In InDesign, if you must remove files from the workflow (because of a production deadline, for example), you can unlink them or cancel an assignment package.

Managed-file workflow examples

When you establish workflow management between InCopy and InDesign, writers and editors can compose, rewrite, expand, and edit documents at the same time that designers prepare the layout. Common workflows include managing files on a local server, sharing files via e-mail packages, or using some combination of the two methods.

These workflows assume that you have a basic InDesign template with layout geometries, styles, and placeholder text. Layout geometries include page dimensions as well as text and graphics frames. InCopy uses these items to show proper copyfit information.

Local server workflow

1. In InDesign, create assignments and add content to them.

This step incorporates exported text and graphics frames into the managed process, where they become available to InCopy users for writing and editing.

2. Make the assignment files available to InCopy users.

Save the files to a server that all workflow users have access to.

3. In InCopy, open the assignment file, and check out and edit a story or graphic.

In InCopy, the files containing content assigned to you appear in the Assignments panel. Whenever you save the file on a local server, the changes are saved on the file system and anyone working on that document (the InDesign layout or another managed content file in the document) receives notification of the changes. Those users can update the content to view the latest changes. The content remains checked out to you until you check it in.

4. In InDesign, work on the layout.

Regardless of whether the content files are being edited in InCopy, InDesign users can work on the document layout; they don't have to check out the document. Whenever the InCopy user saves the checked-out content, the InDesign user can update that content within the layout to see the latest revisions.

5. In InCopy, continue working.

When finished with your edits, check in the content. Other users are then able to check out the content and work on it. If a user is modifying the layout in InDesign simultaneously, you can update and view the layout geometry as you work.

6. In InDesign, make sure that all the content is checked in.

The managed workflow makes it possible to know who has checked out files. After content files are checked in, InDesign users can check out the files to finalize the layout as necessary.

E-mail package workflow

1. In InDesign, create and send assignment packages.

Create assignment packages and assign contents to the appropriate InCopy users, and then send the packages to the InCopy users. The packaged files are automatically checked out to help avoid editing conflicts.

2. In InCopy, open the assignment package, and check out and edit a story or graphic.

If you receive an assignment package in e-mail, double-click the package to open it in InCopy. Changes you make to the file are saved only locally. Other users are not notified when you make changes.

3. In InDesign, work on the layout.

Regardless of whether the content files are packaged, InDesign users can work on the document layout; they don't have to check out the document. If you need to update the layout or assignments, you can send an updated package to the InCopy users.

4. In InCopy, return the edited package.

When finished with your edits, check in the content and return the modified package. Other users are then able to check out the content, view the latest revisions, and work on the file.

5. In InDesign, make sure that all the content is checked in.

The managed workflow makes it possible to know who has checked out files. After assignment packages are returned, stories in assignment packages are checked in. InDesign users can check out the files to finalize the layout as necessary.

Enter user identification

All users in the workflow must have a user name. This identification reveals who has checked out a particular file and makes this information available to other users. It's also required in order to check out a file for editing.

If you've already specified a user name and want to change it, you must check in any content you have checked out. Otherwise, changing user identification during an editing session would forfeit your ability to edit content that you have checked out—it would be checked out to you under a different name.

User identification is application-specific; no single user can have multiple user identifications per application.

***Note:** The InCopy Notes and Track Changes features also use the specified name to identify the author of a note or a tracked change.*

1 Do either of the following:

- Choose File > User.
- Choose User from the Assignments panel menu.

2 Type a unique name and click OK.

If you forget to specify a user name using this method, you're prompted to enter one when you attempt your first workflow action.

***Note:** The Color pop-up menu in this dialog box is for identifying editorial notes and tracked changes. You can choose the color now if you want, but it doesn't affect anything you do in a managed workflow.*

Workflow icons

Icons can appear on text and graphics frames, the Assignments panel, and in the story bar (InCopy only). Edit status icons appear next to the managed file in the Links panel and Assignments panel, and communicate content status. Icons appear on frames that contain a linked InCopy story (in the Layout view in both InDesign and InCopy). These icons also communicate content status and can be used to differentiate between managed and unmanaged content. The associated tool tip indicates editing status and ownership. To view the frame icons, make sure that frame edges are showing in InDesign and InCopy (View > Extras > Show Frame Edges).

Note: (InDesign) The InDesign document window must be in Normal Mode for the frame edges to show. (Click the Normal Mode button  at the lower left of the toolbox.)

Icon	Name	Location
	Available	Assignments panel (InDesign and InCopy), text frames, and graphics frames
	In Use By [name]	Assignments panel, text frames, and graphics frames
	Editing	Assignments panel, text frames, and graphics frames
	Available And Out Of Date	Text and graphics frames
	In Use By [name] And Out Of Date	Text and graphics frames
	Editing And Out Of Date	Text and graphics frames
	Out Of Date	Assignments panel
	Text Content Out Of Date	Assignments panel and text frames
	Text Content Up To Date	Assignments panel and text frames
	Graphics Content Out Of Date	Assignments panel and graphics frames
	Graphics Content Up To Date	Assignments panel and graphics frames
	Packaged Content	Assignments panel

Note: The Out Of Date icon on the Available, In Use, Editing, Text Content, and Graphics Content icons indicates that the content is out of date; that is, the version on the file system is newer than the version displayed on your computer.

Adjusting your workflow

Move content between assignments (InDesign)

InDesign users can move content between existing assignments as well as from the Unassigned InCopy Content section of the Assignments panel. You can also create a new assignment and move content to it.

- 1 Save the InDesign document.
- 2 In the Assignments panel, click the arrow to the left of the name to display the contents of the assignment.
- 3 Select an item in an assignment.
- 4 Do one of the following:
 - Drag the content from one assignment to another.
 - To move content to an existing assignment, choose Add To Assignment from the Assignments panel menu, and then select the desired assignment.
 - To create a new assignment as you move content, from the Assignments panel menu, choose Add To Assignment > New, and then specify options in the New Assignment dialog box.
- 5 Choose Update All Assignments from the Assignments panel menu.

 *If the assignment lists are short, you might prefer dragging content items to and from assignments and the Unassigned InCopy Content section.*

Delete assignments (InDesign)

In the Assignments panel, select one or more assignments and choose Delete Assignment in the panel menu.

Deleting assignments accomplishes the following:

- Removes the assignment data from the document.
- Deletes the assignment file from the file system.
- Removes the assignment name from the list.
- Moves any InCopy content to the Unassigned InCopy Content section in the Assignments panel.

Note: *If an InCopy user has an assignment open when it is deleted in InDesign, an alert message notifies the InCopy user that the assignment has been deleted. However, the content files are not deleted and can be updated without loss of changes.*

Relink missing assignment files (InDesign)

If you move or delete an assignment file from disk, and then open the InDesign doc from which it was created, InDesign won't know where the assignment file is. You need to re-create the assignment file so InDesign can find it.

Re-create the assignment file in the original location

In the Assignments panel, do one of the following:

- Select the missing assignment (it will still be listed in the panel) and choose Update Selected Assignments from the panel menu.
- Choose Update All Assignments from the panel menu.

Change the assignment location

To re-create the assignment file in a new location, do one of the following in the Assignments panel:

- Select the assignment and choose Change Assignment Location from the panel menu. Specify a location and name for the new file.
- Double-click the assignment name. In the Assignment Options dialog box, click Change and specify a location and name for the new file.

Correct mistakes

If you make a mistake, you can discard changes made since the last Save command and restore the content from the file system.

Because InDesign automatically saves every editable InCopy content file when you save the InDesign document, the Cancel Checkout command restores only versions since the last time the document was changed.

Do one of the following:

- To undo the most recent change, choose Edit > Undo *[action]*.
- To undo all changes made since the last time you saved the document, choose File > Revert Content.
- To undo changes since the last saved version and remove the lock file, select the content in the Assignments panel and choose Cancel Check Out from the panel menu. This action makes the content read-only and available for others to check out.

Overriding locked files (InDesign)

Users might not immediately realize how their actions affect others in the workflow, and might accidentally create situations where conflicts exist between content status and ownership. If necessary, the InDesign user can resolve conflicts by unlinking a locked file checked out to a different user and taking control over the file. Unlinking a file stores the content in the InDesign document, but the content is no longer shared with InCopy.

Unlink content files (InDesign)

If necessary (because of a production deadline, for example), InDesign users can remove a content file from the managed workflow and from the Links panel by unlinking it. If you want to make the content available again for editing, you must reexport it as InCopy content using a different file name. This ensures that the old lock file won't prevent users from editing the file.

Note: *Unlinking your own checked-out file removes it from the workflow and deletes the lock file from disk. You can re-export the content and overwrite the file name without conflict.*

To unlink an InCopy content file, select the file (.icml or .incx extension) in the Links panel and choose Unlink from the panel menu. Unlinking embeds the content into the document and removes the link to the InCopy file on disk.

To relink the file, choose Edit > Undo Unlink.

You can also unlink by deleting a frame, or using the InDesign Links panel to relink a content file to another file. You can also select the story in the Assignments panel and drag it to the Trash icon.

Placing InCopy files in InDesign documents

Although a typical workflow begins in InDesign, where the basic layout and text and graphics placeholders are defined and exported to InCopy, a different workflow can start with a stand-alone InCopy content file (.icml or .incx) that you place in InDesign using the File > Place command.

Consider the following dependencies when you place InCopy content files in an InDesign document:

Styles If the InCopy text file has styles applied, they are added to the InDesign list of styles for the document. In the event of a style-name conflict, InDesign overwrites the imported style with its existing style.

Layout You can create the basic layout geometry for the content in InDesign, and then create or import the text and styles from a word-processing application. (Text files placed within InCopy are embedded in the InCopy document and are not linked to any external file.)

Placing/Duplicating If you place an InCopy content file more than once, each instance of the content appears in the InDesign Links panel, but they are all managed as one content file. The same is true for any exact copies of a content file (by any means of duplication).

Note: If you copy and paste some, but not all, of the text in a managed InCopy content file, the result is a new content file that is not connected to the original and has no link to any external file (InCopy or otherwise). The original and the pasted portions can be edited independently of each other.

Updates/Management Once multiple instances of a managed content file are present in an InDesign document, they behave as if they were open in two applications. For example, checking out one instance of the content file locks all other instances so that you can edit only the checked-out instance. In this case, you would use the appropriate Update command to refresh the other (open) instances of the content.

Assignment packages

Create and send packages (InDesign)

Under ideal circumstances, all InDesign and InCopy users on the team have access to a server where assignment files are stored. However, if one or more users don't have access to a common server, you can create and distribute compressed assignment packages. After working on the assignment, the InCopy user repackages the assignment and returns it to be integrated into the InDesign document. Package files created in InDesign include the .icap extension. The return package files created in InCopy include the .idap extension.

There are two commands for packaging files: Package For InCopy and Package And Email. Use Package For InCopy to create a compressed package that you can distribute manually; use Package And Email to create a compressed package that is attached automatically to an e-mail message.

Note: Do not confuse an assignment package with the File > Package command in InDesign that lets you bundle and send a document and its assets to a printer.

Create a package for manual distribution

- 1 Create an assignment and add the content you want to include in the package.

Only content that is checked in can be included in the packaged assignment. If any content is checked out, you're prompted to check in content.

- 2 In the Assignments panel, select the assignment and choose Package For InCopy from the panel menu.
- 3 Specify a name and location for the package file, and click Save.

You can attach the package file to an e-mail message, upload it to an FTP server, or copy it to a disk or other external media.

Note: Choosing Edit > Undo after you create a package cancels the package and unlocks the items in the assignment, but it doesn't delete the package file from your computer or unsend the e-mail.

Create a package for e-mail (InDesign)

- 1 Create an assignment and add the content you want to include in the package.

Only content that is checked in is included in the packaged assignment. If any content is checked out, you're prompted to check in content.

- 2 In the Assignments panel, select the assignment and choose Package For InCopy And Email from the panel menu.
A compressed assignment package is created and attached to an e-mail message of your default e-mail application.

Note: If you want to use a different e-mail application, change the default e-mail application. See your system documentation for details.

- 3 Edit the e-mail message by adding a recipient and providing any instructions. Send the message.

All items in the assignment are checked out to the assigned user. However, the contents of the package itself aren't locked, so anyone can open the package and edit them.

Cancel a package

In some cases, the package you send isn't returned. For example, the message may have gotten lost, or the recipient may no longer work on the project. In such a situation, you can cancel a package.

- 1 In the Assignments panel, select the packaged assignment, and choose Cancel Package from the panel menu.
- 2 Click OK to cancel the package.

Canceling a package doesn't remove the package file from your computer.

When a package is cancelled, the package's contents are available for editing. Be aware that if someone returns a package that has been cancelled, conflicts may occur.

Update a package

After you create a package, you may want to add, remove, or resize items.

- 1 Add, remove, or resize one or more stories to the packaged assignment.
- 2 Select the assignment in the Assignments panel, and do one of the following:
 - Choose Update Package from the Assignments panel menu. Specify the name and location of the file. Make the updated package available to users by placing it on a shared server or by e-mail. Remember to notify InCopy users that the package has been updated.
 - Choose Update Package And Email from the Assignments panel menu, and then send the message.

When InCopy users open the updated package, only new content is added automatically to the assignment; InCopy users can decide whether to overwrite existing content, allowing them to preserve previous edits.

Receive packages (InCopy)

You may receive a package from an InDesign user who created the package or from an InCopy user who forwarded the package to you. When you open an assignment package, the package is decompressed, and the contents are copied to a new subfolder in an InCopy Assignments folder.

Open a package (InCopy)

To open an InCopy package (*.icap or *.incp), do any of the following:

- Launch the package using the e-mail application. For example, double-click the attachment file.
- Use Explorer or Finder to open the file. For example, double-click the file or drag it to the InCopy application icon.
- In InCopy, choose File > Open, and double-click the packaged assignment file.
- In InCopy, choose Open Package from the Assignments panel menu, and then double-click the package file.

You can now edit the stories in the package. When you begin editing a story, you're prompted to check out the contents of the frame. When you've finished editing, save all content and return or forward the package.

Return or forward a package (InCopy)

After you open and edit a package, you can send it to another InCopy user or you can return it to the InDesign user who created the package. Package files created for other InCopy users include the .icap extension; return package files created for InDesign users include the .idap extension.

- 1 Edit and check in the content you want to include in the package.
- 2 From the Assignments panel menu, choose one of the following:

Forward For InCopy Create a package for another InCopy user. Specify the name and location of the package file, and then make it available to the InCopy user.

Forward For InCopy And Email Create and send a package for another InCopy user via e-mail. The package appears as an attachment in a new message in your default e-mail application. Specify the recipient, provide instructions, and send the e-mail message.

Return For InDesign Create a package to return to the InDesign user.

Return For InDesign And Email Create and return a package to the InDesign user by e-mail. The package appears as an attachment in a new message in your default e-mail application. Specify the recipient, provide instructions, and send the e-mail message.

Receive return packages (InDesign)

To open an InDesign package (*.idap or *.indp), do any of the following:

- Launch the package using the e-mail application. For example, double-click the attachment file.
- Use Explorer or Finder to open the file. For example, double-click the file or drag it to the InDesign application icon.
- In InDesign, choose File > Open, and double-click the package file.
- In InDesign, choose Open Package from the Assignments panel menu, and then double-click the package file.

You're prompted to update all links when opening the package. If a story has been modified since the assignment was packaged, you can determine whether to update or unlink the content in the InDesign file. When the stories in the files are returned and checked in, you can check out and edit the content.

Chapter 5: Text

Glyphs and special characters

Glyphs panel overview

Enter glyphs by way of the Glyphs panel. The panel initially shows glyphs in the font where the cursor is located, but you can view a different font, view a type style in the font (for example, Light, Regular, or Bold), and make the panel display a subset of glyphs in the font (for example, math symbols, numbers, or punctuation symbols).

A Search box B Show subset of glyphs C Tool tip displaying glyph ID, Unicode, and Name D Font list E Font style

By moving the pointer over a glyph, you can read its CID/GID value, Unicode value, and name in a tool tip.

Open the Glyphs panel

Choose Type > Glyphs or Window > Type & Tables > Glyphs.

Change the Glyphs panel view

- Click the cycle widget (it's located to the left of the word “Glyphs” on the Glyphs panel) to change views of the panel. Clicking the widget presents these views in succession: the collapsed panel, the entire panel, and the panel without recently used glyphs.
- Click the Zoom In or Zoom Out buttons in the lower-right corner of the Glyphs panel.
- Resize the Glyphs panel by dragging the lower-right corner.

Filter the glyphs that appear

Do one of the following on the Show list to determine which glyphs appear on the Glyphs panel:

- Choose Entire Font to display all glyphs available in the font.
- Choose an option below Entire Font to narrow the list to a subset of glyphs. For example, Punctuation displays only punctuation glyphs; Math Symbols narrows the choices to mathematical symbols.

Sort glyphs in the Glyphs panel

Choose By CID / GID or By Unicode to determine how glyphs are sorted in the Glyphs panel.

Search for glyphs in the Glyphs panel

- 1 In the Glyphs panel, click inside the Search box and enter the search query.

By default, InCopy uses a generic search to search based on the glyph name, Unicode, or glyph ID.

- 2 You can however, specify the search parameter to further filter the search results.

To do this, click the drop-down arrow on the left of the Search box and choose the required search parameter.

Insert glyphs and special characters

A glyph is a specific form of a character. For example, in certain fonts, the capital letter A is available in several forms, such as swash and small cap. You can use the Glyphs panel to locate any glyph in a font.

OpenType fonts such as Adobe Caslon™ Pro provide multiple glyphs for many standard characters. Use the Glyphs panel when you want to insert these alternate glyphs in your document. You can also use the Glyphs panel to view and insert OpenType attributes such as ornaments, swashes, fractions, and ligatures.

Insert special characters

You can insert common characters such as em dashes and en dashes, registered trademark symbols, and ellipses.

- 1 Using the Type tool, position the insertion point where you want to insert a character.
- 2 Choose Type > Insert Special Character, and then select an option from any of the categories in the menu.

If special characters that you use repeatedly do not appear on the list of special characters, add them to a glyph set that you create.

Insert a glyph from a specified font

- 1 Using the Type tool, click to place the insertion point where you want to enter a character.
- 2 Choose Type > Glyphs to display the Glyphs panel.
- 3 To display a different set of characters in the Glyphs panel, do any of the following:
 - Select a different font and type style, if available. From the Show menu, choose Entire Font. Or, if you selected an OpenType font, choose from a number of OpenType categories.
 - Choose a custom glyph set from the Show menu.
- 4 Scroll through the display of characters until you see the glyph you want to insert. If you selected an OpenType font, you can display a pop-up menu of alternate glyphs by clicking and holding the glyph box.
- 5 Double-click the character you want to insert. The character appears at the text insertion point.

Insert a recently used glyph

InCopy tracks the previous 35 distinct glyphs you inserted and makes them available under Recently Used in the first row of the Glyphs panel (you have to expand the panel to see all 35 glyphs on the first row).

Do one of the following:

- Double-click a glyph under Recently Used.
- Choose Recent Glyphs on the Show list to display all recently used glyphs in the main body of the Glyphs panel, and then double-click a glyph.

Clear recently used glyphs

- To clear a selected glyph from the Recently Used section, right-click (Windows®) or Control-click (macOS) a glyph in the Recently Used section, and then choose Delete Glyph From Recently Used.
- To clear all recently used glyphs, choose Clear All Recently Used.

Replace a character with an alternate glyph

When a character includes alternate glyphs, it appears in the Glyphs panel with a triangle icon in the lower-right corner. You can click and hold the character in the Glyphs panel to display a pop-up menu of the alternate glyphs, or you can display alternate glyphs in the Glyphs panel.

- 1 Choose Type > Glyphs to display the Glyphs panel.
- 2 Select Alternates For Selection from the Show list.
- 3 Using the Type tool, select a character in your document.
- 4 Do one of the following to replace the selected character in the document:
 - Double-click a glyph in the Glyphs panel.
 - Select a glyph on the menu.

Display OpenType glyph attributes in the Glyphs panel

For easy selection, the Glyphs panel allows you to display characters for only the selected OpenType attributes. You can select various options from the Show menu in the Glyphs panel.

Note: Do not confuse these options with those that appear on the Glyphs panel menu, which let you apply forms to selected text.

Text

- 1 In the Glyphs panel, choose an OpenType font from the font list.
- 2 Choose an option from the Show menu.

The options displayed vary depending on which font is selected.

Highlight alternate glyphs in the text

- 1 Choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).
- 2 Select Substituted Glyphs, and then click OK. Substituted glyphs in the text are highlighted in nonprinting yellow.

Create and edit custom glyph sets

A *glyph set* is a named collection of glyphs from one or more fonts. Saving commonly used glyphs in a glyph set prevents you from having to look for them each time you need to use them. Glyph sets are not attached to any particular document; they are stored with other InDesign preferences in a separate file that can be shared.

You can determine whether the font is remembered with the added glyph. Remembering fonts is useful, for example, when you are working with dingbat characters that may not appear in other fonts. If a glyph's font is remembered, but the font is missing, the font's square appears in pink in the Glyphs panel and the Edit Glyph Set dialog box. If a font is not remembered with an added glyph, a "u" appears next to the glyph, indicating that the font's unicode value determines the appearance of the glyph.

Create a custom glyph set

- 1 Choose Type > Glyphs.
- 2 Do one of the following:
 - From the Glyphs panel menu, choose New Glyph Set.
 - Open the context menu on the Glyphs panel and choose New Glyph Set.
- 3 Type the name of the glyph set.

Text

- 4 Choose the insert order in which glyphs will be added to the glyph set, and click OK:
 - Insert At Front** Each new glyph is listed first in the set.
 - Append At End** Each new glyph is listed last in the set.
 - Unicode Order** All glyphs are listed by the order of their unicode values.
- 5 To add glyphs to the custom set, select the font containing the glyph at the bottom of the Glyphs panel, click the glyph to select it, and then choose the name of the custom glyph set from the Add To Glyph Set menu on the Glyphs panel menu.

View a custom glyph set

Do one of the following on the Glyphs panel:

- Choose the glyph set on the Show list.
- On the Glyphs panel menu, choose View Glyph Set, and then the name of the glyph set.

Edit custom glyph sets

- 1 Choose Edit Glyph Set from the Glyph panel menu, and then choose the custom glyph set.
- 2 Select the glyph you want to edit, do any of the following, and then click OK:
 - To bind the glyph to its font, select Remember Font With Glyph. A glyph that remembers its font ignores the font applied to the selected text in the document when the glyph is inserted into that text. It also ignores the font specified in the Glyph panel itself. If you deselect this option, the Unicode value of the current font is used.
 - To view additional glyphs, choose a different font or style. If the glyph is not defined with a font, you cannot select a different font.
 - To remove a glyph from the custom glyph set, choose Delete From Set.
 - To change the order in which glyphs are added to the set, choose an Insert Order option. Unicode Order is not available if Insert At Front or Append At End was selected when the glyph set was created.

Delete glyphs from custom glyph sets

- 1 In the Glyphs panel, choose the Custom Glyph Set from the Show menu.
- 2 Right-click (Windows) or Control-click (macOS) a glyph, and then choose Delete Glyph From Set.

Delete custom glyph sets

- 1 Do one of the following:
 - From the Glyphs panel menu, choose Delete Glyph Set.
 - From the context menu, choose Delete Glyph Set.
- 2 Click the name of a custom glyph set.
- 3 Click Yes to confirm.

Save and load glyph sets

Custom glyph sets are stored in files kept in the Glyph Sets folder, a subfolder of the Presets folder. You can copy glyph set files to other computers and in so doing make custom glyph sets available to others. Copy glyph set files to and from these folders to share them with others:

macOS Users\[username]\Library\Preferences\Adobe InCopy \[Version]\[Language]\Glyph Sets

Text

Windows Users\[username]\AppData\Roaming\Adobe\InCopy \[Version]\[Language]\Glyph Sets

Use quotation marks

You can specify different quotation marks for different languages. These quotation mark characters appear automatically during typing if the Use Typographer's Quotes option is selected in the Type section of the Preferences dialog box.

Specify which quotation marks to use

- 1 Choose Edit > Preferences > Dictionary (Windows) or InCopy > Preferences > Dictionary (macOS).
- 2 Choose a language from the Language menu.
- 3 Do any of the following, and then click OK:
 - For Double Quotes, select a pair of quotation marks, or type the pair of characters you want to use.
 - For Single Quotes, select a pair of quotation marks, or type the pair of characters you want to use.

Insert straight quotation marks

Do one of the following:

- Choose Type > Insert Special Character > Quotation Marks > Straight Double Quotation Marks or Straight Single Quotation Mark (Apostrophe).
- Deselect the Use Typographer's Quotes option in the Type section of the Preferences dialog box, and then type the quotation mark or apostrophe.
- Press Shift+Ctrl+Alt+' (Windows) or Shift+Command+Option+' (macOS) to switch between turning on and off the Use Typographer's Quotes preferences option.

 *The character frequently used to indicate feet, arcminutes, or minutes of time is the prime mark. It looks like a slanted apostrophe. The character frequently used to indicate inches, arcseconds, or seconds of time is the double prime mark. These symbols are different from apostrophes and double quotation marks. Some fonts include the prime and double prime marks. Use the Glyphs panel to insert these marks. If the font doesn't have a prime or double prime mark, insert the straight quotation mark, and italicize it.*

Insert white space characters

A *white space character* is a blank space that appears between characters. You can use white-space characters for many different purposes, such as preventing two words from being broken at the end of a line.

- 1 Using the Type tool, position the insertion point where you want to insert a certain amount of white space.
- 2 Choose Type > Insert White Space, and then select one of the spacing options (such as Em Space) in the context menu.

 *Representative symbols of the white-space characters appear when you choose Type > Show Hidden Characters.*

White space options

The following options appear on the Type > Insert White Space menu:

Ideographic Space

Text

This is a space that is based on a full-width character in Asian languages. It wraps to the next line as with other full-width characters.

Em Space —

Equal in width to the size of the type. In 12-point type, an em space is 12 points wide.

En Space —

One-half the width of an em space.

Nonbreaking Space ^

The same flexible width as pressing the spacebar, but it prevents the line from being broken at the space character.

Nonbreaking Space (Fixed Width) ^

A fixed width space prevents the line from being broken at the space character, but does not expand or compress in justified text. The fixed width space is identical to the Nonbreaking Space character.

Third Space •

One-third the width of an em space.

Quarter Space •

One-fourth the width of an em space.

Sixth Space ;

One-sixth the width of an em space.

Flush Space ~

Adds a variable amount of space to the last line of a fully justified paragraph, useful for justifying text in the last line.

Hair Space ..

One-twenty-fourth the width of an em space.

Thin Space .

One-eighth the width of an em space. You may want to use a thin space on either side of an em dash or en dash.

Figure Space

Same width as a number in the typeface. Use a figure space to help align numbers in financial tables.

Punctuation Space

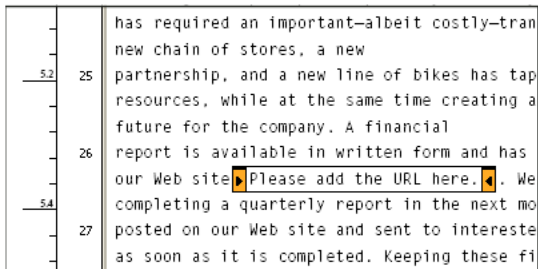

Same width as an exclamation point, period, or colon in the typeface.

Text

Using editorial notes

About editorial notes

Editorial notes are brief comments or annotations for yourself or other contributors. In Galley and Story views, all notes are displayed inline (within the text), and the content of the note is displayed between note bookends . In Layout view, each note is indicated by a note anchor . The content of the note is displayed in the Notes panel and can be color-coded for each user.

Notes panel overview

The Notes panel contains the name of the note's author, the date and time it was last modified, the story label, the page number, the note number out of total notes, the number of characters and words, and the content of the note.

A User color B Show/Hide notes C Go to note anchor D Go to previous note E Go to next note F New note G Delete note

Note: Regardless of which view you are using, the content of the Notes panel appears the same.

Text

Open the Notes panel

Do one of the following:

- Choose Window > Notes.
- In Layout view, choose Notes > New Note.

Use Notes Mode

Notes Mode is a convenient way to add, split, or delete notes, depending on where the insertion point is located or what text is selected.

- 1 Do any of the following:
 - To create a new note, place the insertion point in text.
 - To convert text to a note, select the text.
 - To split a note, place the insertion point inside a note.
 - To convert the note to text, select the note bookends (in Galley view or Story view).
 - To move the insertion point out of a note, place the insertion point at the beginning or end of the note.
- 2 Choose Notes > Notes Mode.

Add a note

- 1 Do either of the following:
 - Using the Type tool , click where you want to place the note, and choose Notes > New Note.
 - Using the Note tool , click where you want to place the note.

Adding a note in Layout view opens the Notes panel if it is not already open.

- 2 In Galley or Story view, type your note between the note bookends. In Layout view, type your note in the Notes panel.

You can add as many notes as you want in any location. However, you cannot create a note within another note.

You can also add a note using Notes Mode.

Convert text to a note

- 1 Select the text that you want to move into a new note.
- 2 Choose Notes > Convert To Note.

A new note is created. The selected text is removed from the body of the story and pasted into the new note. The note anchor or bookend is located where the text you selected was cut.

If you add notes to a linked InCopy story, they also appear in the story in InDesign, and can be edited in InDesign.

You can also convert text to a note using Notes Mode.

 You can assign keyboard shortcuts to convert a word, line, paragraph, or story to a note. Choose Edit > Keyboard Shortcuts, and then choose Notes Menu from the Product Area menu. Add a shortcut to the command, and click OK.

Convert notes to text

- 1 Open the Notes panel.
- 2 Select the text in the Notes panel that you want to add to the text of the document. Or, in Galley view, select the text in the inline note.
- 3 Choose Notes > Convert To Text.

You can also convert notes to text using Notes Mode.

Note: If you select only a portion of the note contents when you convert the contents to text, the original note will be divided into two separate notes, and the portion of the note contents that is converted to text will appear between the two new notes.

Navigate between notes

When you navigate through notes, the active text insertion point moves from the current note anchor to the anchor of the next or previous note. When navigating between notes in Layout view, click the Go to Note Anchor button  to view the note anchor associated with the note displayed in the Notes panel.

- 1 Click anywhere within the contents of a story.
- 2 Do one of the following:
 - Choose Notes > Previous Note or Notes > Next Note.
 - Select Previous Note or Next Note from the Notes panel menu.
 - Click the Go To Previous Note button  or the Go To Next Note button  in the Notes panel.

Note: In the Galley and Story views, you can use the Find/Change command to locate a note. The Notes section of the Preferences dialog box contains a setting to include notes in Find/Change searches.

Split a note

- 1 In the Notes panel or in the note itself, place the insertion point where you want to split the note.
You cannot split a note if the insertion point is at the beginning or end of the note, or if the note is empty.
- 2 Do one of the following:
 - Choose Notes > Split Note.
 - Choose Split Note from the Notes panel menu. The active text insertion point is placed between the two split notes.

You can also split a note using Notes Mode.

Expand or collapse notes

When expanded, the content of the note appears between the bookends. As you enter the content of the note, the bookends move apart to accommodate the text. You can collapse the bookends to hide the content of the note.

- 1 Select the Type tool , and then click the begin-note bookend  or the end-note bookend .
- 2 If the insertion point is in a note container, choose Notes > Collapse Note.

To expand or collapse all notes in the active story, choose Notes > Expand/Collapse Notes In Story.

Select and open a note in Layout view

A note anchor  marks the location of a note in Layout view. The Notes panel displays the contents of the note, along with specific information about the note.

- 1 Select the Type tool  or Note tool .
- 2 Move the pointer over the note anchor until the pointer appears as a pointing hand.
- 3 Do one of the following:
 - Click the note anchor.
 - Choose Notes > Previous Note or Notes > Next Note.

Edit a note

- In Galley view or Story view, select the Type tool , and then click between the bookends of the note you want to edit, and make your changes.
- In Layout View, select the Type tool , click the note anchor to open the note in the Notes panel, and make your changes.

Check spelling or find/change text in notes

- 1 Select the Galley or Story view tab.
- 2 Expand the notes you want to spell-check or search. Choose Notes > Expand/Collapse Notes In Story to expand all notes.
- 3 Choose Edit > Spelling > Check Spelling or Edit > Find/Change.

Note: If you choose Change All while spell-checking or finding text, text in collapsed notes is ignored in Galley View or Story View, but all occurrences of the text are replaced in Layout View.

Move or duplicate notes

You can move or duplicate notes.

Move or duplicate notes in Galley and Story views

- 1 Shift+Alt-click (Windows) or Shift+Option-click (macOS) the start-note or end-note bookend to select the note.
- 2 Do one of the following:
 - Drag the selected note to move it.
 - Shift-drag the selected note to duplicate it.

Duplicate a note anchor in Layout view

Do one of the following:

- Using the Type tool , drag across the note anchor to highlight it, and then choose Edit > Copy. Paste it in a different location.
- Using the Note tool or Type tool, hold down Shift, and drag the anchor to where you want to place it in the text.

Delete notes

- To delete a single note, Shift+Alt-click (Windows) or Shift+Option-click (macOS) the start-note or end-note bookend to select the note, and then choose Notes > Delete Note.
- To delete all notes in the active story, choose Notes > Remove Notes From Story.
- To delete all notes in the document, choose Notes > Remove All Notes.

Printing and exporting notes

When you print an InCopy document, you can print any notes that are included in the document at the same time. You can also export notes from InCopy as PDF annotations. However, notes in tables are not exported as PDF annotations.

Specify note preferences

Preferences settings let you set the color for note anchors, bookends, and backgrounds when inline in the Galley and Story views. You can also choose to display note info as a tool tip, as well as choose whether to include note content in Find/Change operations and spell checking in the Galley and Story views.

- 1 Choose Edit > Preferences > Notes (Windows) or InCopy > Preferences > Notes (macOS).
- 2 Select a color for note anchors and note bookends from the Note Color menu. Select [User Color] to use the color specified in the User dialog box. This is especially useful if more than one person is working on the file.
- 3 Select Show Note Tool Tips to display note information and some or all of the note content as a tool tip when the mouse pointer hovers over a note anchor in Layout view or a note bookend in Galley or Story view.
- 4 Specify whether you want to include inline note content when using the Find/Change and Spell Check commands (in Galley and Story views only).

Note: In Layout view, you cannot use the Find/Change and Spell Check commands to search for the contents of notes, regardless of the settings in the Preferences dialog box. However, Change All does edit the contents of notes.

- 5 Select either [None] or [Note Color] (the color you chose in step 2) to use for the background color of an inline note.
- 6 Click OK.

To show or hide notes, choose View > Show Notes or Hide Notes.

Using the thesaurus

About the thesaurus

The thesaurus lets you look up synonyms, related words, and antonyms for words you specify. For example, if you specify “figment,” the InCopy thesaurus provides synonyms such as “fiction” and “fable,” related words such as “concoction” and “fantasy,” and antonyms such as “fact.”

The search for a word doesn’t need to end with the first set of synonyms, related words, and antonyms you find. You can look up any one of the suggested words and display its synonyms, related words, and antonyms. You can quickly go back to any of the last 10 words you looked up.

A .Lookup B .Change To C .Language menu D . Current Lookup Word E . Meanings menu F .Definition G .Category menu H .Result list I .Load Word J .Lookup Word K .Change Word

InCopy provides the following categories for looking up words:

Synonyms Words having the same or nearly the same meaning as the lookup word.

Antonyms Words having the opposite or nearly the opposite meaning as the lookup word.

See Also Words that are conceptually related to the lookup word, although neither a synonyms nor antonyms.

Near Synonyms Words having a somewhat similar meaning as the lookup word.

Near Antonyms Words having a meaning that is somewhat akin to the opposite meaning of the lookup word.

Look up words in the thesaurus

You can use the thesaurus to look up synonyms, antonyms, and brief definitions of words.

Look up a word visible in the document window

- 1 Choose Window > Thesaurus to open the Thesaurus panel.
- 2 Using the Type tool , select the word you want to look up, and do one of the following:
 - Copy and paste the word into the Lookup text box.
 - Click the Load Word button .
- 3 Select the language you want to use.
- 4 Click the Lookup Word button  or press Enter.

A brief definition of the word is displayed in the Definition area of the Thesaurus panel. The Result list displays related words based on the selections you made from the Meanings and Category menus.

Note: You can drag the vertical bar that separates the Definition area and the Result list from side to side to adjust the relative width of the two areas.

Text

- 5 Select the part of speech you want to look up from the Meanings menu. For example, if you want the noun meaning for the word, select noun. If you want the verb meaning, select verb. Not all meanings are available for all words.
- 6 Select the category (such as Synonyms or Antonyms) you want to look up from the Categories menu. Not all categories are available for all words.

To replace the word in the Lookup field, Alt-click (Windows) or Option-click (macOS) a word in the Result list, and then click the Lookup Word button. To replace the word in the Change To field, click a word in the Result list.

Look up a word not visible in the document window

- 1 Choose Window > Thesaurus to open the Thesaurus panel.
- 2 Type the word you want to look up in the Lookup text box, and press Enter.

Look up a word again

- 1 Choose Window > Thesaurus to open the Thesaurus panel.
- 2 Choose the word from the Lookup pop-up menu in the Thesaurus panel. This menu lists the last 10 words you looked up.
- 3 Click the Lookup Word button .

Insert a word from the Thesaurus panel

You can use the Thesaurus panel to add or replace words in your document. When replacing a selected word in your document with a word from the Thesaurus panel, you replace only the selected word—not all occurrences of the word. To replace all occurrences, use the Find/Change command.

***Note:** If the thesaurus cannot find a matching entry for the string of text in the Lookup text box, all other text boxes in the Thesaurus panel remain empty.*

- 1 Do one of the following:
 - To add the word, place the insertion point in the document where you want to add the word.
 - To replace a word in the document, select the word.
- 2 Select a word from the Result list in the Thesaurus panel.
- 3 Click the Change Word button , or double-click a word in the Result list.

Using text macros

Create a text macro

A *textmacro* is a shortcut for a sequence of keystrokes. A macro can be simple—it can type a word or phrase you use often—or it can be complex, such as a formatted address. A *macro code* is the name of the text macro you create. For example, instead of repeatedly typing “Centers for Disease Control and Prevention,” you can create a macro code (such as “cdc”) that changes to the full name.

- 1 Choose Window > Text Macros.
- 2 If you want to create a text macro from existing text, select the text in the document.
- 3 Choose New Macro from the Text Macros panel menu, or click the New Macro button  in the Text Macros panel.
- 4 Enter a macro code in the Macro Code text box. Note that macro codes are case-sensitive.

The code appears in the Text Macros list.

- 5 For Macro Text, type the text string that you want entered when you activate the text macro.
- 6 To include text attributes from the existing text when inserting or swapping macro text, select Remember Text Attributes. By default, inserted or swapped macro text uses the style attributes of the destination paragraph.
- 7 To assign a keyboard shortcut for activating the macro, place the cursor in the Macro Key Shortcut text box, and press the keys you want to use for the shortcut.

Shortcuts are especially useful if you turn off Automatically Swap Macro Text in the Text Macros panel.

If the keyboard shortcut you want to assign to the macro is already assigned to another function, the alert symbol appears at the bottom of the dialog box with the message “Currently Assigned To: *[function]*.” If you choose to assign the keyboard shortcut to the macro, the previous keyboard shortcut function is overridden. Click OK.

You can replace the macro code with macro text automatically while typing, by using a macro key shortcut, or by choosing Swap Macro Text from the Text Macros panel menu.

Edit a text macro

- 1 From the list in the Text Macros panel, double-click the text macro you want to edit, or select it and click the Edit Text Macro button  in the Text Macros panel.
- 2 Enter your changes in the text box, and click OK.

Duplicate a macro

Use the Duplicate Macro command to create a copy of an existing macro. The duplicate macro is assigned the same code as the original, but with a number appended to it, and is listed immediately after the original macro in the Text Macros panel. For example, duplicating the macro “DOT” creates a copy of the macro, named “DOT1.”

- 1 Select the text macro you want to duplicate from the list in the Text Macros panel.
- 2 Choose Duplicate Macro from the Text Macros panel menu.

Delete a text macro

- 1 Select the text macro you want to delete from the Text Macros panel list.
- 2 Choose Delete Macro from the Text Macros panel menu.

Note: Once you delete a macro, you cannot undo the deletion.

Insert or swap macro text

You can insert macro text in three different ways: Using the Insert Macro Text command to insert macro text at the insertion point, having macro text inserted automatically while typing, or swapping existing text with macro text.

Insert macro text automatically

If Automatically Swap Macro Text is selected, macro codes are automatically converted to macro text while you type. For example, if you created a macro code named “cdc,” when you type cdc followed by a word-ending character such as a space or period, Center for Disease Control and Prevention appears. The macro code is case-sensitive.

- 1 Make sure that Automatically Swap Macro Text from the Text Macros panel menu is selected. (A check mark should appear next to it.)
- 2 Type the macro code followed by a word-ending character (space, comma, period, or paragraph return).

 *If you want to restore the macro code text, choose Edit > Undo until the macro code reappears.*

Insert macro text at the insertion point

The Insert Macro Text command places the selected macro text at the current text insertion point.

- 1 Using the Type tool , click the location where you want to insert the macro text.
- 2 Do one of the following:
 - Press the macro keyboard shortcut for the macro you want.
 - Select the macro you want from the Text Macros panel, and choose Insert Macro Text from the panel menu, or click the Insert Macro Text button .

Swap text with macro text

The Swap Macro Text command searches the text immediately preceding the current text insertion point for any defined macro code (case-sensitive) and, if one is found, removes the macro code and replaces it with the associated macro text. For example, you have created a text macro for Centers for Disease Control and Prevention, and the macro code is CDC. To use the macro, type **The CDC**, and then with the text insertion point placed immediately following the macro code, choose Swap Macro Text. InCopy then searches the text immediately preceding the insertion point and replaces CDC with the macro text Centers for Disease Control and Prevention.

- 1 Using the Type tool , click to the immediate right of the macro code that you want to replace, or select the text you want to replace.
- 2 Choose Swap Macro Text from the Text Macros panel menu, or choose Edit > Swap Macro Text.

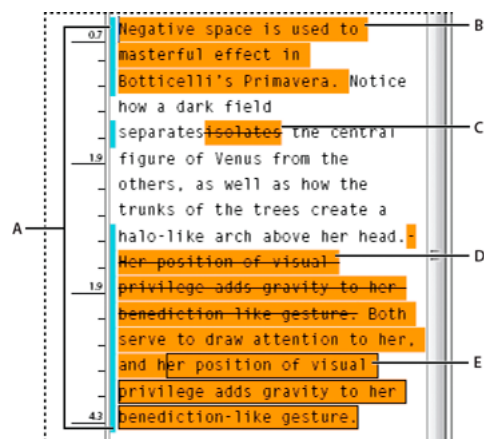

Note: The Swap Macro Text command does not continue to search the entire document for every occurrence of the macro code. To find and replace all instances of a word or phrase, use the Find/Change command.

Tracking and reviewing changes

Track changes

A valuable feature is the ability to track changes made to a story by each contributor in the writing and editing process. Whenever anyone adds, deletes, or moves text within an existing story, the change is marked in the Story Editor in InDesign or the Galley and Story views in InCopy. You can then accept or reject the changes.

Use the Track Changes panel in InDesign or the Track Changes toolbar in InCopy to turn Track Changes on or off and to show, hide, accept, or reject changes made by contributors.

A Change bars B Added text C Deleted text D Moved text (from) E Moved text (to)

Turn on change tracking

- 1 Choose Window > Editorial > Track Changes to open the Track Changes panel (InDesign), or choose Window > Track Changes to open the Track Changes toolbar (InCopy).
- 2 With the insertion point in text, do any of the following:
 - To enable change-tracking in only the current story, click the Enable Track Changes In Current Story icon .
 - (ID) To enable tracking in all stories, choose Enable Track Changes In All Stories from the Track Changes menu.
 - (InCopy) To enable tracking in all open stories, choose Changes > Enable Tracking In All Stories.
- 3 Add, delete, or move text within the story as needed.

Note: When Track Changes is turned on, a track changes icon  appears at the right end of the Story bar in Galley view and Story view.

How change tracking is displayed

When Track Changes is turned on, each change is marked by default as follows in Story Editor (InDesign) or in Galley and Story views (InCopy):

 The Track Changes section of the Preferences dialog box lets you choose a color to identify your changes. It also lets you select which changes (adding, deleting, or moving text) you want tracked and the appearance of tracking.

Added text Highlighted.

Deleted text Highlighted and marked with a strikethrough.

Moved (cut-and-pasted) text Highlighted and marked with a strikethrough in its original location; highlighted and boxed in the new location.

Text

Note: If you cut text from one document and paste it into another, it is displayed as deleted text in the document of its original location and as added text in its new location.

Copied text Highlighted in the new location. The original text is unchanged.

Change bars A change bar is a vertical line that appears to the left of a line of text that has been changed. You can choose whether to show or hide change bars as you work. You can also specify what color to use for displaying the change bars.

Show or hide changes

When changes are hidden, the text appears as it would with the change-tracking feature turned off. That is, added text is visible, deleted text is invisible, and moved or pasted text appears where it has been inserted.

(InDesign) When change-tracking is turned on, editing is tracked regardless of whether you work in Story Editor or in the document layout. You can view changes only in Story Editor, not in the layout.

(InCopy) When change-tracking is turned on, editing is tracked regardless of whether you work in Galley, Story, or Layout view. You can view changes only in the Galley and Story views, not the Layout view.

In the Track Changes panel (InDesign) or the Track Changes toolbar (InCopy), click the Show/Hide Changes button

Turn off change tracking

With the insertion point in text, do any of the following:

- To disable change-tracking in only the current story, click the Disable Track Changes In Current Story icon .
- (InDesign) To disable tracking in all stories, choose Disable Track Changes In All Stories from the Track Changes panel menu.
- (InCopy) To disable tracking in all open stories in a multistory document, choose Changes > Disable Tracking In All Stories.

Note: If you disable tracking, no further changes are tracked. Previously tracked changes are not affected.

View change information in the Track Changes panel

- 1 Choose Window > Track Changes.
- 2 Click the insertion point in a change. The Track Changes panel displays the date, time, and other change information.

Accept and reject changes

When changes have been made to a story, whether by you or by others, the change-tracking feature enables you to review all changes and decide whether to incorporate them into the story. You can accept or reject single changes, only portions of a tracked change, or all changes at once.

When you accept a change, it becomes a normal part of the text flow and is no longer highlighted as a change. When you reject a change, the text reverts to how it was before the change was made.

- 1 In Story Editor (InDesign) or Galley or Story view (InCopy), position the insertion point at the beginning of the story.
- 2 In the Track Changes panel (InDesign) or the Track Changes toolbar (InCopy), click the Next Change button .
- 3 Do any of the following:
 - To accept the highlighted change and incorporate it into the text flow, click the Accept Change button .

Text

- To reject the change and revert to the original text, click the Reject Change button .
-  To accept or reject the highlighted change and go to the next change, Alt-click (Windows) or Option-click (macOS) the Accept Change or Reject Change button.
- To move back to the previous change or skip over a change and go to the next one, click the Previous Change button  or Next Change button .
- To accept or reject all changes without reviewing, click the Accept All Changes In Story button  or the Reject All Changes In Story button .
- To accept or reject all changes in the story or in the document, or to accept or reject all changes by a certain participant, choose the appropriate option from the Track Changes panel menu (InDesign) or from the Changes menu (InCopy).

Note: If you change your mind about accepting or rejecting a change, you can undo the change by choosing *Edit > Undo* or pressing *Ctrl+Z* (Windows) or *Command+Z* (macOS).

Choosing an Accept All Changes or Reject All Changes command also applies to hidden conditional text.

Set Track Changes preferences

Preference settings let you control many tracking options. You can choose a color to identify your changes and select what changes you want tracked: adding, deleting, or moving text. You can also set the appearance of each type of tracked change, and you can have changes identified with colored change bars in the margins.

- 1 Choose *Edit > Preferences > Track Changes* (Windows) or *InCopy > Preferences > Track Changes* (macOS).
- 2 Select each type of change that you want to track.
- 3 For each type of change, specify the text color, background color, and marking method.
- 4 Select *Prevent Duplicate User Colors* to ensure that all users are assigned different colors.
- 5 To show change bars, select the *Change Bars* option. Choose a color from the *Change Bar Color* menu, and specify whether you want change bars to appear in the left or right margin.
- 6 Select *Include Deleted Text When Spellchecking* if you want to spell-check text marked to be deleted.
- 7 Click *OK*.

Change the user name and color

- 1 Close all open stories.
- 2 Choose *File > User*.
- 3 Specify the user name and color to be used for change-tracking and notes, and then click *OK*.

Text variables

Create and edit text variables

A *text variable* is an item you insert in your document that varies according to the context. For example, the Last Page Number variable displays the page number of the last page of the document. If you add or remove pages, the variable is updated accordingly.

InCopy includes several preset text variables that you can insert in your document. You can edit the format of these variables, or you can create your own. Some variables, such as Running Header and Chapter Number, are especially useful for adding to master pages to ensure consistent formatting and numbering. Other variables, such as Creation Date and File Name, are useful for adding to the slug area for printing.

Note: Adding too much text to a variable may cause overset or compressed text. Variable text does not break across lines.

Create or edit text variables

The options available for creating the variable depend on the type of variable you specify. For example, if you choose the Chapter Number type, you can specify text to appear both before and after the number, and you can specify the numbering style. You can create several different variables based on the same variable type. For example, you can create one variable that displays “Chapter 1” and another that displays “Ch. 1.”

Similarly, if you choose the Running Header type, you can specify which style is used as the basis for the header, and you can select options for deleting end punctuation and changing the case.

- 1 If you want to create text variables for use in all new documents you create, close all documents. Otherwise, the text variables you create appear only in the current document.
- 2 Choose Type > Text Variables > Define.
- 3 Click New, or select an existing variable and click Edit.
- 4 Type a name for the variable, such as “Full Chapter” or “Running Title.”
- 5 From the Type menu, choose a variable type, specify the options for that type, and then click OK.

Different options are available depending on the variable type you select.

Text Before / Text After For all variable types (except Custom Text), you can specify text that will be added before or after the variable. For example, you can add the word “of” before the Last Page Number variable and the phrase “total pages” after the variable to create an “of 12 total pages” effect. You can also paste text into the boxes, but special characters such as tabs and auto page numbers are stripped out. To insert special characters, click the triangle to the right of the text box.

Style For all numbered variable types, you can specify the numbering style. If [Current Numbering Style] is selected, the variable uses the same numbering style selected in the document’s Numbering & Section Options dialog box.

Variable types

Chapter Number

A variable created with the Chapter Number type inserts the chapter number. You can insert text before or after the chapter number, and you can specify a numbering style.

If the document’s chapter number is set to continue from the previous document in the book, you may need to update the book’s numbering in order for the appropriate chapter number to appear.

Text**Creation Date, Modification Date, and Output Date**

Creation Date inserts the date or time the document is first saved; Modification Date inserts the date or time the document was last saved to disk; Output Date inserts the date or time the document starts a print job, exports to PDF, or packages the document. You can insert text before and after the date, and you can modify the date format for all date variables.

Date Format You can type date formats directly into the Date Format box, or you can choose format options by clicking the triangle to the right of the box. For example, the date format “MM/dd/yy” displays as 12/22/07. By changing the format to “MMM. d, yyyy” the date will display as Dec. 22, 2007.

Date variables use the language applied to text. For example, the creation date may appear in Spanish text as “01 diciembre 2007” and in German as “01 Dezember 2007.”

Abbreviation	Description	Example
M	Month number, no leading zero	8
MM	Month number, leading zero	08
MMM	Abbreviated month name	Aug
MMMM	Full month name	August
d	Day number, no leading zero	5
dd	Day number, leading zero	05
E	Weekday name, abbreviated	Fri
EEEE	Full weekday name	Friday
yy or YY	Year number, last two digits	07
y (Y) or yyyy (YYYY)	Full year number	2007
G or GGGG	Era, abbreviated or expanded	AD or Anno Domini
h	Hour, no leading zero	4
hh	Hour, leading zero	04
H	Hour, no leading zero, 24-hour format	16
HH	Hour, leading zero, 24-hour format	16
m	Minute, no leading zero	7
mm	Minute leading zero	07
s	Second, no leading zero	7
ss	Second, leading zero	07
a	AM or PM, two characters	PM
z or zzzz	Time zone, abbreviated or expanded	PST or Pacific Standard Time

File Name

This variable inserts the name of the current file into the document. It’s commonly added to the slug area of the document for printing or used in headers and footers. In addition to Text Before and Text After, you can choose the following options.

Text

Include Entire Folder Path Select to include the full folder path with the file name. The standard path conventions for either Windows or macOS are used.

Include File Extension Select to include the file name extension.

The File Name variable is updated whenever you save the file with a new name or to a new location. The path or extension does not appear in the document until it's saved.

Image Name

The Image Name variable is useful for generating automatic captions from metadata. The Image Name variable includes a Metadata Caption variable type. If a text frame containing this variable is adjacent to or grouped with an image, the variable displays the metadata of that image. You can edit the Image Name variable to determine which metadata field is used.

Last Page Number

The Last Page Number type is useful for adding the total number of pages in a document to headers and footers using the common "Page 3 of 12" format. In this case, the number 12 is generated by the Last Page Number, and it's updated whenever pages are added or removed. You can insert text before or after the last page number, and you can specify a numbering style. From the Scope menu, choose an option to determine whether the last page number in the section or document is used.

Note that the Last Page Number variable does not count the pages in the document.

Running Header (Paragraph or Character Style)

The Running Header variables insert the first or last occurrence on the page of the text to which the specified style is applied. If no text on the page is formatted with the specified style, the text from a previous page is used.

Custom Text

This variable is commonly used for inserting placeholder text, or a text string that may need to be changed quickly. For example, if you're working on a project that uses a code name for a company, you can create a custom text variable for the code name. When you are able to use the real company name, you can simply change the variable to update all the occurrences.

To insert special characters in a text variable, click the triangle to the right of the text box.

Insert text variables

- 1 Place the insertion point where you want the variable to appear.
- 2 Choose Type > Text Variables > Insert Variable, and then choose the variable you want to insert.

The variable appears on the page as if you'd typed it in the document. For example, the Creation Date variable might appear as December 22, 2007. If you choose Type > Show Hidden Characters, the variable instance is surrounded by a box using the current layer color.

Note: Text variables do not break across lines.

Delete, convert, and import text variables

Use the Text Variables dialog box to delete, convert, and import text variables.

Delete text variables

If you want to delete an instance of a text variable inserted in a document, simply select the variable and press Backspace or Delete. You can also delete the variable itself. When you do so, you can decide how to replace the variables inserted in the document.

- 1 Choose Type > Text Variables > Define.
- 2 Select the variable, and then click Delete.
- 3 Specify how the variable will be replaced by specifying a different variable, converting the variable instances to text, or deleting the variable instances altogether.

Convert text variables to text

- To convert a single instance, select the text variable in the document window, and then choose Type > Text Variables > Convert Variable To Text.
- To convert all instances of the text variable in the document, choose Type > Text Variables > Define, select the variable, and then click Convert To Text.

Import text variables from another document

- 1 Choose Type > Text Variables > Define.
- 2 Click Load, and then double-click the document that has the variables you want to import.
- 3 In the Load Text Variables dialog box, make sure that a check mark appears next to the variables you want to import. If any existing variable has the same name as one of the imported variables, choose one of the following options under Conflict With Existing Text Variable, and then click OK:

Use Incoming Definition Overwrites the existing variable with the loaded variable and applies its new attributes to all text in the current document that used the old variable. The definitions of the incoming and existing variables are displayed at the bottom of the Load Text Variables dialog box so that you can view a comparison.

Auto-Rename Renames the loaded variable.

- 4 Choose OK, and then click Done.

You can also copy variables to other documents when you synchronize a book file.

Create variables for running headers and footers

By default, the Running Header variables insert the first occurrence (on the page) of the text to which the specified style is applied. Running Header variables are especially useful for displaying the current heading or title in the header or footer.

- 1 If your content is not already formatted, create and apply the paragraph style or character style for the text you want to appear in the header (such as a title or heading style).
- 2 Choose Type > Text Variables > Define.
- 3 Click New, and then type a name for the variable.
- 4 From the Type menu, choose Running Header (Paragraph Style) or Running Header (Character Style).
- 5 Specify the following options:
 - Style** Choose the style to display in your header or footer.

Text

Use Decide whether you want the first or last occurrence of the style that's applied on the page. First On Page is the first paragraph (or character) that begins on a page. If there is no occurrence of the style on the page, the previous occurrence of the applied style is used. If there is no previous occurrence in the document, the variable is empty.

Delete End Punctuation If selected, the variable displays the text minus any end punctuation (periods, colons, exclamation points, and question marks).

Change Case Select this option to change the case of the text that appears in the header or footer. For example, you may want to use sentence case in your footer, even though the heading on the page appears in title case.

- 6 Click OK, and then click Done in the Text Variables dialog box.

You can now insert the variable in a header or footer you create on the master page.

If a header or footer text frame has been created on the master page of the InDesign document, you can insert the variable in the header or footer.

Define caption variables

Caption variables are updated automatically when a text frame containing a caption variable is moved next to an image. By default, the Name metadata is used for the variable type when you choose Type > Text Variables > Insert Variable > Image Name. You can edit the Image Name variable, or you can create new variables that specify image metadata.

- 1 Choose Type > Text Variables > Define.
- 2 Choose New to create a variable or Edit to edit an existing variable.
- 3 For Type, select Metadata Caption.
- 4 Choose an option from the Metadata menu.
- 5 Specify text that appears before or after the metadata, and then choose OK.

Hyperlinks

Hyperlinks panel overview

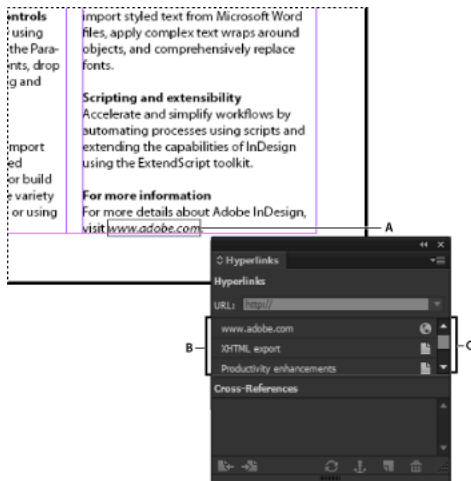

You can create hyperlinks so that when you export to Adobe PDF or SWF in InDesign, a viewer can click a link to jump to other locations in the same document, to other documents, or to websites. Hyperlinks you export to PDF or SWF in InCopy are not active.

A *source* is hyperlinked text, a hyperlinked text frame, or a hyperlinked graphics frame. A *destination* is the URL, file, email address, page text anchor, or shared destination to which a hyperlink jumps. A source can jump to only one destination, but any number of sources can jump to the same destination.

A *source* is hyperlinked text or a hyperlinked graphic. A *destination* is the URL, file, email address, page, text anchor, or shared destination to which a hyperlink jumps. A source can jump to only one destination, but any number of sources can jump to the same destination.

Text

Note: If you want the source text to be generated from the destination text, insert a cross-reference instead of adding a hyperlink.

A Hyperlink source B List of hyperlinks in the current document C Hyperlink status icons

Open the Hyperlinks panel

- Choose Window > Interactive > Hyperlinks.
- Choose Window > Hyperlinks.
- Choose Window > Type & Tables > Cross-References.

Sort hyperlinks in the Hyperlinks panel

Choose Sort from the Hyperlinks panel menu, and then choose any of the following:

Manually Displays the hyperlinks in the order in which they were added to the document.

By Name Displays the hyperlinks in alphabetical order.

By Type Displays the hyperlinks in groups of similar type.

Display hyperlinks in smaller rows

Choose Small Panel Rows from the Hyperlinks panel menu.

Create hyperlinks

You can create hyperlinks to pages, URLs, text anchors, email addresses, and files. If you create a hyperlink to a page or text anchor in a different document, make sure that the exported files appear in the same folder.

To show or hide hyperlinks, choose View > Extras > Show Hyperlinks or Hide Hyperlinks.

Note: Hyperlinks are included in exported Adobe PDF files if Hyperlinks is selected in the Export Adobe PDF dialog box in InDesign. Hyperlinks are included in the exported SWF file if Include Hyperlinks is selected in the Export SWF dialog box.

Create a hyperlink to a web page (URL)

You can use several different methods to create hyperlinks to URLs. When you specify a URL, you can use any valid Internet resource protocol: http://, file://, ftp://, or mailto://.

Text

You can also use the Buttons feature to link to web pages.

You may want to create a character style for hyperlinks. Hyperlinks are often formatted in underlined blue text.

- 1 Select the text, frame, or graphic you want to be the hyperlink's source. For example, you can select the text, "See the Adobe website."
- 2 In the Hyperlinks panel, use any of the following methods to create a hyperlink to a URL:
 - In the URL text box, type or paste the URL name (such as <http://www.adobe.com>), and then choose New Hyperlink from the Hyperlinks panel. Choose URL from the Link To menu, specify appearance options, and click OK.
 - If a URL is selected in your document, choose New Hyperlink From URL in the Hyperlinks panel menu. Double-click the hyperlink in the Hyperlinks panel, and then choose URL from the Link To menu, specify appearance options, and click OK.
 - Select a previously added URL from the URL menu. The hyperlink appearance is the same as that used in the previous URL.
 - Choose New Hyperlink in the Hyperlinks panel menu. Choose URL from the Link To menu, specify appearance options, and click OK.

Note: *If a URL hyperlink isn't working in the exported PDF, there may be a problem with the hyperlink being a "Shared Destination." Double-click the hyperlink in the Hyperlinks panel, choose URL from the Link To menu, deselect Shared Hyperlink Destination, and click OK.*

Create a hyperlink to a file

When you create a hyperlink to a file, clicking the hyperlink in the exported PDF or SWF file opens the file in its native application, such as Microsoft Word for .doc files.

Make sure the file you specify is available to anyone opening the PDF or SWF file you export. For example, if you're sending the exported PDF to a coworker, specify a file located on a shared server rather than your hard drive.

- 1 Select the text, frame, or graphic you want to be the source of the hyperlink.
- 2 Choose New Hyperlink in the Hyperlinks panel menu, or click the Create New Hyperlink button at the bottom of the Hyperlinks panel.
- 3 In the New Hyperlink dialog box, choose File from the Link To menu.
- 4 For Path, type the pathname or click the folder button to locate and double-click the filename.
- 5 Select Shared Hyperlink Destination if you want the file to be stored in the Hyperlinks panel for easy reuse.
- 6 Specify the appearance of the hyperlink source, and then click OK.

Create a hyperlink to an email message

- 1 Select the text, frame, or graphic you want to be the source of the hyperlink.
- 2 Choose New Hyperlink in the Hyperlinks panel menu, or click the Create New Hyperlink button at the bottom of the Hyperlinks panel.
- 3 In the New Hyperlink dialog box, choose Email from the Link To menu.
- 4 For Address, type the email address, such as username@company.com.
- 5 For Subject Line, type the text that appears in the subject line of the email message.

Text

- 6 Select Shared Hyperlink Destination if you want the email message to be stored in the Hyperlinks panel for easy reuse.
- 7 Specify the appearance of the hyperlink source, and then click OK.

Create a hyperlink to a page

You can create a hyperlink to a page without first creating a destination. However, by creating a page destination, you can specify a page number and view setting.

- 1 Select the text, frame, or graphic you want to be the source of the hyperlink.
- 2 Choose New Hyperlink in the Hyperlinks panel menu, or click the Create New Hyperlink button at the bottom of the Hyperlinks panel.
- 3 In the New Hyperlink dialog box, choose Page from the Link To menu.
- 4 For Document, select the document containing the destination that you want to jump to. All open documents that have been saved are listed in the pop-up menu. If the document you're looking for isn't open, select Browse in the pop-up menu, locate the file, and then click Open.
- 5 For Page, specify the page number you want to jump to.
- 6 For Zoom Setting, do one of the following to select the view state of the page being jumped to:
 - Select Fixed to display the magnification level and page position that were in effect when you created the link.
 - Select Fit View to display the visible portion of the current page as the destination.
 - Select Fit In Window to display the current page in the destination window.
 - Select Fit Width or Fit Height to display the width or height of the current page in the destination window.
 - Select Fit Visible to display the page so that its text and graphics fit the width of the window, which usually means that the margins are not displayed.
 - Select Inherit Zoom to display the destination window at the magnification level the reader uses when the hyperlink is clicked.
- 7 Specify appearance options, and then click OK.

Create a hyperlink destination

Creating a hyperlink destination is necessary only if you're creating a hyperlink or cross-reference to a *text anchor*. A text anchor can point to a selection of text or to the insertion point location. Then you create the hyperlink or cross-reference that points to the hyperlink destination. You can also create hyperlink destinations for pages and URLs, but a destination isn't necessary for those links.

Hyperlink destinations you create do not appear in the Hyperlinks panel; they appear in the dialog box that appears when you're creating or editing hyperlinks.

- 1 If you're creating a text anchor, use the Type tool to place the insertion point, or select the range of text that you want to be the anchor.

You cannot set up an anchor destination for text on a master page.
- 2 Choose New Hyperlink Destination in the Hyperlinks panel menu.
- 3 Choose Text Anchor in the Type menu. Specify a name for the text anchor, and then click OK.
- 4 Do any of the following, and then click OK:
 - Choose Text Anchor in the Type menu. Specify a name for the text anchor.

Text

- Choose Page in the Type menu. Specify the page number you want to jump to and the Zoom Setting. Type a name for the page, or select Name With Page Number to name the destination automatically based on the page number and zoom setting you specify.
- Choose URL in the Type menu. Type or paste a URL, such as *http://www.adobe.com*. You can use any valid Internet resource protocol: *http://*, *file://*, *ftp://*, or *mailto://*.

Create a hyperlink to a text anchor

- 1 Select the text, frame, or graphic you want to be the source of the hyperlink.
- 2 Choose New Hyperlink in the Hyperlinks panel menu, or click the Create New Hyperlink button at the bottom of the Hyperlinks panel.
- 3 Choose Text Anchor from the Link To menu.
- 4 For Document, select the document containing the destination that you want to jump to. All open documents that have been saved are listed in the pop-up menu. If the document you're looking for isn't open, select Browse in the pop-up menu, locate the file, and then click Open.
- 5 From the Text Anchor menu, choose the text anchor destination you created.
- 6 Specify hyperlink appearance options, and then click OK.

Create a hyperlink to any shared destination

While creating a hyperlink, if you choose Shared Destination from the Link To menu, you can specify any named destination. A destination is named when you add a URL using the URL text box or when you select Shared Hyperlink Destination while creating a hyperlink to a URL, file, or email address.

- 1 Select the text, frame, or graphic you want to be the source of the hyperlink.
- 2 Choose New Hyperlink in the Hyperlinks panel menu, or click the Create New Hyperlink button at the bottom of the Hyperlinks panel.
- 3 In the New Hyperlink dialog box, choose Shared Destination from the Link To menu.
- 4 For Document, select the document containing the destination that you want to jump to. All open documents that have been saved are listed in the pop-up menu. If the document you're looking for isn't open, select Browse in the pop-up menu, locate the file, and then click Open.
- 5 Choose a destination from the Name menu.
- 6 Specify hyperlink appearance options, and then click OK.

Hyperlink appearance options

The options determine the appearance of the hyperlink or cross-reference source in the exported PDF or SWF file. These appearance options are also displayed in the InDesign document if you choose View > Extras > Show Hyperlinks.

Character Style Choose a character style to apply to the hyperlink source. The Character Style option is available only if the hyperlink source is selected text, not a selected frame or graphic.

If you're inserting a cross-reference, you can apply a character style when you edit a cross-reference format. You can also apply character styles to building blocks within a format.

Type Select Visible Rectangle or Invisible Rectangle.

Highlight Select Invert, Outline, Inset, or None. These options determine the appearance of the hyperlink when it's being clicked in the PDF or SWF file.

Color Select a color for the visible hyperlink rectangle.

Text

Width Select Thin, Medium, or Thick to determine the thickness of the hyperlink rectangle.

Style Select Solid or Dashed to determine the appearance of the hyperlink rectangle.

Convert URLs to hyperlinks

You can find and convert URLs (such as “www.adobe.com”) in your document and convert them to hyperlinks.

- 1 Choose Convert URLs To Hyperlinks from the Hyperlinks panel menu.
- 2 For Scope, indicate whether you want to convert URLs in the entire document, the current story, or the current selection.
- 3 To apply a character style to the hyperlink, select a character style from the Character Style menu.
- 4 Do any of the following, and then click Done.
 - Click Find to locate the next URL.
 - Click Convert to convert the current URL to a hyperlink.
 - Click Convert All to convert all URLs to hyperlinks.

Manage hyperlinks

Use the Hyperlinks panel to edit, delete, reset, or locate hyperlinks. In InCopy, you can manage hyperlinks only if the story is checked out for editing.

Edit hyperlinks

- 1 In the Hyperlinks panel, double-click the item you want to edit.
- 2 In the Edit Hyperlinks dialog box, make changes to the hyperlink as necessary, and then click OK.

Note: To edit a hyperlink to a URL, select the hyperlink, edit the URL in the URL text box, and then press Tab or Enter.

Delete hyperlinks

When you remove a hyperlink, the source text or graphic remains.

Select the item or items you want to remove in the Hyperlinks panel, and then click the Delete button at the bottom of the panel.

Rename a hyperlink source

Renaming the hyperlink source changes the way it appears in the Hyperlinks panel.

- 1 In the Hyperlinks panel, select the hyperlink.
- 2 Choose Rename Hyperlink from the Hyperlinks panel menu, and specify a new name.

Edit or delete hyperlink destinations

- 1 Open the document in which the destination appears.
- 2 Choose Hyperlink Destination Options in the Hyperlinks panel menu.
- 3 For Destination, select the name of the destination you want to edit.
- 4 Do one of the following:
 - Click Edit, and then make changes to the destination as necessary.
 - Click Delete to remove the destination.

Text

- 5 When you have finished editing or deleting destinations, click OK.

Reset or update hyperlinks

- 1 Select the range of text, the text frame, or the graphic frame that will act as the new hyperlink source. For example, you may want to select additional text to include in the source.
- 2 Select the hyperlink in the Hyperlinks panel.
- 3 Do either of the following:
 - Choose Reset Hyperlink in the Hyperlinks panel menu.
 - To update hyperlinks to external documents, choose Update Hyperlink in the Hyperlinks panel menu.

Go to a hyperlink source or anchor

- To locate the source of a hyperlink or cross-reference, select the item you want to locate in the Hyperlinks panel. Choose Go To Source in the Hyperlinks panel menu. The text or frame will be selected.
- To locate the destination of a hyperlink or cross-reference, select the item you want to locate in the Hyperlinks panel. Choose Go To Destination in the Hyperlinks panel menu.

If the item is a URL destination, InDesign starts or switches to your web browser to display the destination. If the item is a text anchor or page destination, InDesign jumps to that location.

Editing hyperlinks imported from Word

When a Microsoft Word document with hyperlinks is imported into an InDesign document, you may notice a box or border around the hyperlink URLs (such as www.adobe.com). The InDesign document inherits a blue swatch called Word_R0_G0_B255. The document also inherits a character style called “Hyperlink” that underlines the text and applies the blue color.

To remove the box, in the Hyperlinks panel, double-click the hyperlink. Under Appearance, choose Invisible Rectangle from the Type menu, and click OK.

You may also want to delete the imported swatch. While doing so, you can replace it with a different swatch.

 *Before you place the Word document in InDesign, you may want to remove the hyperlinks from the URLs in the Word document to avoid inheriting this formatting. See your Word documentation. Another option is to create a character style named “Hyperlink” in the InDesign document before you import. When you import the Word document, the InDesign style that has the same name is used by default.*

Adding text

Adding text

You can add text by typing, pasting, or importing text from another file. In general, you use standard word-processing techniques to work with text in InCopy. Select the Type tool  on the toolbox, and then use the techniques described below. These methods work the same way in Galley, Story, and Layout views, whether or not the content is linked to Adobe InDesign®.

Typing Click the insertion point where you want to add text, and begin typing.

Selecting Drag, double-click, or triple-click to select individual characters, words, lines, or paragraphs (depending on the Preferences settings). Or click anywhere in the content, and choose Edit > Select All.

Pasting Copy or cut text, click at the location you want, and choose Edit > Paste. If you want to remove the formatting of the pasted text, choose Edit > Paste Without Formatting. If you want to add or remove spacing as necessary, select Adjust Spacing Automatically When Cutting And Pasting Words in the Type section of the Preferences dialog box.

You can also use Edit > Paste Without Grid Format to paste text into a frame grid so that the pasted text retains its font, font size, and character spacing settings of the copied text.

Deleting Select the text you want to delete, and choose Edit > Clear.

You can also import text directly from another text document.

Importing files

You can import text from other InCopy stories, Microsoft® Word, Microsoft Excel, and any application that can export text in Rich Text Format (RTF) or text-only format. All importable file formats are listed in the InCopy Place dialog box (in the Files Of Type menu for Windows®, and in the right list pane for macOS).

Document formatting and styles

You can import files with or without formatting. If you import the files with formatting, InCopy imports most character and paragraph formatting attributes from text files, but ignores most page-layout information, such as page breaks, margins, and column settings (which you can set in InDesign). In general, InCopy imports all formatting information specified in the word-processing application, except for features not available in InCopy.

If InCopy has an import filter for an application, you can determine which styles are imported, and which formatting to use if there is a name conflict.

Note: *InDesign controls the styles in linked InCopy stories. When you place an InCopy story in InDesign, any imported styles in the InCopy document are overridden in InDesign if there are conflicting style names.*

Saving files for import

If your word-processing application can save files in more than one file format, try using the format capable of retaining the most formatting—either the application's native file format or an interchange format such as Rich Text Format (RTF).

You can import files created in the recent versions of Microsoft Word. If you are placing a file from a different word-processing application or from Word 95 for Windows or earlier, open the file in its original application and save it in a compatible Word format or in RTF, which preserves most formatting.

Place (import) text

For large amounts of text, the Place command is the most useful way to import content. InCopy supports a variety of word-processing, spreadsheet, and text file formats. The degree to which the original formatting is preserved depends on the import filter for the file type and the options you choose as you place the file. You can also open Word, text, and RTF files directly in InCopy.

- 1 Using the Type tool , click where you want the text to appear.
- 2 Choose File > Place.
- 3 In the Place dialog box, select Show Import Options if you want to display a dialog box containing import options for the type of file you're placing.
- 4 Select the text file you want to place, and then click Open. (If you Shift-click Open, the Import Options dialog box appears, even if Show Import Options isn't selected.)
- 5 Do any of the following:
 - If a dialog box displays import options for the type of file you're placing, select any options you want, and click OK.
 - If the document you're importing contains fonts that aren't available on your system, a dialog box opens to inform you of the font substitution. If you prefer to specify other substitution fonts, click Find Font and choose alternatives.

 *If the text you import into your document includes pink, green, or another color of highlighting, you likely have one or more composition preference options turned on. Open the Composition section of the Preferences dialog box, and notice which options are turned on under Highlight. For example, if the placed text is formatted with fonts not available in InCopy, the text is highlighted in pink.*

Import options

When you import Word, Excel, and tagged text files, you can determine how the files are imported.

Microsoft Word and RTF import options

If you select Show Import Options when placing a Word file or an RTF file, you can choose from these options:

Table Of Contents Text Imports the table of contents as part of the text in the story. These entries are imported as text only.

Index Text Imports the index as part of the text in the story. These entries are imported as text only.

Footnotes Imports Word footnotes. Footnotes and references are preserved, but renumbered based on the document's footnote settings. If the Word footnotes are not imported properly, try saving the Word document in RTF format and importing the RTF file.

Endnotes Imports endnotes as part of the text at the end of the story.

Use Typographer's Quotes Ensures that imported text includes left and right quotation marks (“ ”) and apostrophes (') instead of straight quotation marks (" ") and apostrophes (').

Remove Styles And Formatting From Text And Tables Removes formatting, such as typeface, type color, and type style, from the imported text, including text in tables. Paragraph styles and inline graphics aren't imported if this option is selected.

Preserve Local Overrides When you choose to remove styles and formatting from text and tables, you can select Preserve Local Overrides to maintain character formatting, such as bold and italics, that is applied to part of a paragraph. Deselect this option to remove all formatting.

Text

Convert Tables To When you choose to remove styles and formatting from text and tables, you can convert tables to either basic, unformatted tables or unformatted, tab-delimited text.

If you want to import unformatted text and formatted tables, import the text without formatting, and then paste the tables from Word into InCopy .

Preserve Styles And Formatting From Text And Tables Preserves the Word document's formatting in the InDesign or InCopy document. You can use the other options in the Formatting section to determine how styles and formatting are preserved.

Manual Page Breaks Determines how page breaks from the Word file are formatted in InDesign or InCopy. Select Preserve Page Breaks to use the same page breaks used in Word, or select Convert To Column Breaks or No Breaks.

Import Inline Graphics Preserves inline graphics from the Word document in InCopy .

Import Unused Styles Imports all styles from the Word document, even if the styles aren't applied to text.

Convert Bullets & Numbers To Text Imports bullets and numbers as actual characters, preserving the look of the paragraph. However, in numbered lists, the numbers are not automatically updated when the list items are changed.

Track Changes Selecting this option causes Track Changes markups from the Word document to appear in the InCopy document. In InDesign, view track changes in Story Editor.

Import Styles Automatically Imports styles from the Word document into the InDesign or InCopy document. If a yellow warning triangle appears next to Style Name Conflicts, then one or more paragraph or character styles from the Word document have the same name as an InCopy style.

To determine how these style name conflicts are resolved, select an option from the Paragraph Style Conflicts and Character Style Conflicts menu. Choosing Use InCopy Style Definition causes the imported style text to be formatted based on the InCopy style. Choosing Redefine InCopy Style causes the imported style text to be formatted based on the Word style, and changes existing InCopy text formatted with the Word style. Choosing Auto Rename causes the imported Word styles to be renamed. For example, if InCopy and Word have a Subheading style, the imported Word style is renamed Subheading_wrd_1 when Auto Rename is selected.

Note: InCopy converts paragraph and character styles but not bulleted and numbered list styles.

Customize Style Import Lets you use the Style Mapping dialog box to select which InCopy style should be used for each Word style in the imported document.

Save Preset Stores the current Word Import Options for later reuse. Specify the import options, click Save Preset, type the name of the preset, and click OK. The next time you import a Word style, you can select the preset you created from the Preset menu. Click Set As Default if you want the selected preset to be used as the default for future imports of Word documents.

Text-file import options

If you select Show Import Options when placing a text file, you can choose from these options:

Character Set Specifies the computer language character set, such as ANSI, Unicode UTF8, or Windows CE, that was used to create the text file. The default selection is the character set that corresponds to the default language and platform of InDesign or InCopy.

Specifies the computer language character set, such as ANSI, Unicode UTF8, Shift JIS, or Chinese Big 5, that was used to create the text file. The default selection is the character set that corresponds to the default language and platform of InDesign or InCopy.

Platform Specifies whether the file was created in Windows or macOS.

Set Dictionary To Specifies the dictionary to be used by the imported text.

Text

Extra Carriage Returns Specifies how extra paragraph returns are imported. Choose Remove At End Of Every Line or Remove Between Paragraphs.

Replace Replaces the specified number of spaces with a tab.

Use Typographer's Quotes Ensures that imported text includes left and right quotation marks (“ ”) and apostrophes (') instead of straight quotation marks (" ") and apostrophes (').

Microsoft Excel import options

You can choose from these options when importing an Excel file:

Sheet Specifies the worksheet you want to import.

View Specifies whether to import any stored custom or personal views, or to ignore the views.

Cell Range Specifies the range of cells, using a colon (:) to designate the range (such as A1:G15). If there are named ranges within the worksheet, these names appear in the Cell Range menu.

Import Hidden Cells Not Saved In View Includes any cells formatted as hidden cells in the Excel spreadsheet.

Table Specifies how the spreadsheet information appears in the document.

Formatted Table InCopy tries to preserve the same formatting used in Excel, although the formatting of text within each cell may not be preserved. If the spreadsheet is linked rather than embedded, updating the link will override any formatting applied to the table in InCopy .

Unformatted Table The table is imported without any formatting from the spreadsheet. When this option is selected, you can apply a table style to the imported table. If you format text using paragraph and characters styles, the formatting is preserved even if you update the link to the spreadsheet.

Unformatted Tabbed Text The table is imported as tab-delimited text, which you can then convert to a table in InDesign or InCopy.

Formatted Only Once InDesign preserves the same formatting used in Excel during the initial import. If the spreadsheet is linked rather than embedded, formatting changes made to the spreadsheet are ignored in the linked table when you update the link. This option isn't available in InCopy.

Table Style Applies the table style you specify to the imported document. This option is available only if Unformatted Table is selected.

Cell Alignment Specifies the cell alignment for the imported document.

Include Inline Graphics Preserves inline graphics from the Excel document in InCopy .

Number Of Decimal Places To Include Specifies the number of decimal places of spreadsheet figures.

Use Typographer's Quotes Ensures that imported text includes left and right quotation marks (“ ”) and apostrophes (') instead of straight quotation marks (" ") and apostrophes (').

Tagged-text import options

You can import (or export) a text file capable of taking advantage of InCopy formatting capabilities by using the *tagged text* format. Tagged-text files are text files containing information describing the formatting you want InCopy to apply. Properly tagged text can describe almost anything that can appear in an InCopy story, including all paragraph-level attributes, character-level attributes, and special characters.

Text

The following options are available when you import a tagged-text file and select Show Import Options in the Place dialog box.

Use Typographer's Quotes Ensures that imported text includes left and right quotation marks (“ ”) and apostrophes (') instead of straight quotation marks (" ") and apostrophes (').

Remove Text Formatting Removes formatting, such as typeface, type color, and type style, from the imported text.

Resolve Text Style Conflicts Using Specifies which character or paragraph style to apply when there is a conflict between the style in the tagged-text file and the style in the InDesign document. Select Publication Definition to use the definition that already exists for that style in the InDesign document. Select Tagged File Definition to use the style as defined in the tagged text.

Show List Of Problem Tags Before Place Displays a list of unrecognized tags. If a list appears, you can choose to cancel or continue the import. If you continue, the file may not look as expected.

Type Asian text using inline input

1 Choose Edit > Preferences > Advanced Type (Windows) or InCopy > Preferences > Advanced Type (macOS).

2 Select Use Inline Input For Non-Latin Text, and then click OK.

You can use a system input method, if available, for adding 2-byte and 4-byte characters. This method is especially useful for entering Asian characters.

You can use a special input program to input Asian text directly into text frames.

Checking spelling

Check spelling

You can check the spelling in a document or in all open stories. InCopy highlights misspelled or unknown words, repeated words (such as “the the”), uncapitalized words, and uncapitalized sentences. When performing a spell check, InCopy checks all XML content and expanded inline notes.

When you check spelling, InCopy uses the dictionary for the languages you assigned to the text in your document. InCopy uses the Proximity language dictionaries for both spelling and hyphenation. Each dictionary contains hundreds of thousands of words with standard hyphenation breaks.

For stand-alone stories (stories not linked to an InDesign layout), you can customize language dictionaries to ensure that any unique vocabulary you use is recognized and treated correctly. For example, when you run a spelling check (Edit > Spelling > Check Spelling), you can click Add and enter the settings you want.

Set spelling preferences

1 Choose Edit > Preferences > Spelling (Windows) or InCopy > Preferences > Spelling (macOS).

2 Do any of the following:

- Select Misspelled Words to find words that do not appear in the language dictionary.
- Select Repeated Words to find duplicate words such as “the the.”
- Select Uncapitalized Words to find words (such as “germany”) that appear in the dictionary only as capitalized words (“Germany”).
- Select Uncapitalized Sentences to find uncapitalized words following periods, exclamation points, and question marks.

3 Select Enable Dynamic Spelling to underline potentially misspelled words while you type.

Text

- 4 Specify the underline color of misspelled words (words not found in the user dictionaries), repeated words (such as “the the”), uncapitalized words (such as “nigeria” instead of “Nigeria”), and uncapitalized sentences (sentences that don’t begin with a capital letter).

Note: To spell-check notes, make sure that Include Note Content When Checking Spelling is selected in Notes preferences. To spell-check deleted text, make sure that Include Deleted Text When Spellchecking is selected in the Track Changes preferences.

Check spelling

- 1 If your document includes foreign-language text, select the text and use the Language menu on the Character panel to specify the language for that text.

- 2 Choose Edit > Spelling > Check Spelling.

Spell-checking begins.

Note: The Check Spelling command does not check collapsed stories in a multistory file. However, when you select Change All or Ignore All, all collapsed stories and tables are affected.

- 3 If you want to change the range of your spell-checking, do any of the following, and then click Start to begin checking the spelling:

- Select Document to check the entire document. Select All Documents to check all open documents.
- Select Story to check all text in the currently selected frame, including text in other threaded text frames and overset text. Select Stories to check stories in all selected frames.
- Select To End Of Story to check from the insertion point.
- Select Selection to check only selected text. This option is available only if text is selected.

- 4 When unfamiliar or misspelled words or other possible errors are displayed, choose an option:

- Click Skip to continue spell-checking without changing the highlighted word. Click Ignore All to ignore all occurrences of the highlighted word, until InCopy is restarted.
- Select a word from the Suggested Corrections list or type the correct word in the Change To box, and then click Change to change only that occurrence of the misspelled word. You can also click Change All to change all occurrences of the misspelled word in your document.
- To add a word to a dictionary, select the dictionary from the Add To menu, and click Add.
- Click Dictionary to display the Dictionary dialog box, where you can specify the target dictionary and language, and specify hyphenation breaks in the added word. If you want to add the word to all languages, choose All Languages from the Language menu. Click Add.

Correct spelling errors as you type

By turning on Autocorrect, you can allow capitalization errors and common typing mistakes to be replaced while you type. Before Autocorrect will work, you must create a list of commonly misspelled words and associate them with the correct spelling.

- 1 Choose Edit > Preferences > Autocorrect (Windows) or InCopy > Preferences > Autocorrect (macOS).
- 2 Choose Enable Autocorrect. (You can also choose Edit > Spelling > Autocorrect to turn this feature on or off quickly.)
- 3 From the Language menu, choose which language the autocorrections are applied to.
- 4 To correct capitalization errors (such as typing “germany” instead of “Germany”), select Autocorrect Capitalization Errors. You don’t need to add the capitalized words to the list of autocorrections.

Text

5 To add a word that you commonly misspell, click Add, type the misspelled word (such as “teh”), type the correction (such as “the”), and then click OK.

6 Continue to add words that you commonly misspell, and then click OK.

When you type any misspelled word you added to the list, the word is automatically replaced by the word you entered as the correction.

To remove autocorrect words you’ve added, select the word in the list and choose Remove. To edit autocorrect words, select the word, click Edit, retype the correction, and click OK.

Use dynamic spelling

When dynamic spelling is enabled, you can correct spelling errors by using the context menu. Potentially misspelled words are underlined (based on the dictionary associated with the language of the text). If you type text in different languages, select the text and assign the correct language.

1 To enable dynamic spelling, choose Edit > Spelling > Dynamic Spelling.

Potentially misspelled words are underlined in your document.

2 Right-click (Windows) or Control-click (macOS) the underlined word, and do one of the following:

- Select a suggested correction. If a word is repeated or needs to be capitalized, you can choose Delete Repeated Word *[word]* or Capitalize *[word]*.
- Select Add *[word]* To User Dictionary. This automatically adds the word to the current dictionary without opening the Dictionary dialog box. The word remains unchanged in the text.
- Select Dictionary. This opens the Dictionary dialog box where you can select the Target dictionary, change hyphenation breaks, and specify a language. If you want to add the word to all languages, choose All Languages from the Language menu, and then click Add. The word is added to the selected dictionary and remains unchanged in the text.
- Select Ignore All to ignore occurrences of this word in all documents. When InCopy is restarted, the word is flagged again as a misspelling.

Note: If you select Ignore All and then decide that you don’t want to ignore that word after all, Choose Ignored Words from the Dictionary List menu in the Dictionary dialog box and remove the word from the list.

Hyphenation and spelling dictionaries

InCopy uses Proximity dictionaries for most languages to verify spelling and to hyphenate words. You can add words to each dictionary to customize it. You can assign different languages to text, and InCopy uses the appropriate dictionary to handle spelling and hyphenation. You can create additional user dictionaries, and you can import or export word lists saved in a plain text file.

When you customize the words in a dictionary, you actually create lists of added words (words that aren’t already in the dictionary) and removed words (existing dictionary words that you want to be flagged as a potential misspelling). The Dictionary dialog box lets you display and edit added words, removed words, and ignored words (words that are ignored for the current session because you clicked Ignore All). You can add words that apply to all languages, which is especially useful for last names, street names, and other items that aren’t specific to a language.

 If you want to use the language dictionaries from a previous version of InDesign or InCopy, use your system Find command to locate the user dictionary files (.udc), and then add them to your list of dictionaries in Dictionary preferences.

Where dictionary words are stored

By default, hyphenation and spelling exceptions are located in user dictionary files stored outside the document on the computer where InCopy is installed (dictionary file names end with a .clam or .not extension). However, you can also store exception lists inside any InCopy document. In addition, you can store word lists in an external user dictionary, in the document, or in both. The location of existing dictionaries appears in the Dictionary preferences.

Storing hyphenation and spelling exceptions inside a document makes it easier to treat text consistently when you move that document to other computers. For this reason, you can merge the user dictionary into the document in Dictionary preferences. You can also control the location of exceptions from the Create Package Folder dialog box. In contrast, storing an exception list outside the document makes it easier to use the same list of exceptions for multiple documents.

Note: *If the user dictionary is merged into the exceptions list, the entire user dictionary is added to the document, even if the words are not used, thereby increasing the document's file size.*

Applying languages to text

You can use the Language menu in the Character panel to apply a language to selected text. You can also specify a default language for an entire document, or for all new documents. InCopy also includes a language locking feature that prevents the language setting in Asian text from being changed when it is part of a selection and a non-Asian language is chosen from the Language menu.

You can use the Language menu in the Control panel or Character panel to apply a language to selected text. You can also specify a default language for an entire document, or for all new documents.

Exception word lists

You can exclude words from being considered. For example, if you want to use an alternate spelling for a common word such as “bicycle,” which you may need to spell in a different way for your company name or for a specific document, add the word to the list of excluded words so that it will be flagged during a spell check. InCopy can maintain a separate set of added and removed words for each installed language.

Create or add user dictionaries

You can create a user dictionary, or you can add user dictionaries from previous InDesign or InCopy versions, from files that others have sent you, or from a server where your workgroup's user dictionary is stored. The dictionary you add is used for all your InCopy documents.

- 1 Choose Edit > Preferences > Dictionary (Windows) or InCopy > Preferences > Dictionary (macOS).
- 2 From the Language menu, choose the language with which you want to associate the dictionary.
- 3 Do one of the following:
 - To create a new dictionary, click the New User Dictionary icon  below the Language menu. Specify the name and location of the user dictionary (which includes a .udc extension), and then click Save.
 - To add an existing dictionary, click the Add User Dictionary icon , select the user dictionary file, which includes a .udc or .not extension, and then click Open.

Note: *If you can't find the dictionary file, you might want to use your system Find command to locate the .udc files (try using *.udc), note the location, and then try again.*

The dictionary is added to the list under the Language menu. You can add words to the dictionary when checking spelling or by using the Dictionary dialog box.

Set the default language dictionary for the current document

You can change the default language dictionary for a document or for all new documents you create. Changing the default dictionary in an existing document doesn't affect text that has already been created or text that you type into an existing text frame.

 Use the Character Style or Paragraph Style panel to set a specific dictionary for a specific style. The Language menu appears in the Advanced Character Formats section.

- 1 Open the document.
- 2 Select the Selection tool from the toolbar and make sure no items are selected in the document.
- 3 Choose Type > Character.
- 4 Choose the desired dictionary from the Language menu on the Character panel. If you cannot see the language option in the Character panel, select Show Options and then select your language from the list.

Set the default language dictionary for all new documents

- 1 Start InCopy, but do not open a document.
- 2 Choose Type > Character.
- 3 Choose the desired dictionary from the Language pop-up menu on the Character panel. If you cannot see the language option in the Character panel, select Show Options and then select your language from the list.

Remove, relink, and reorder user dictionaries

- 1 Choose Edit > Preferences > Dictionary (Windows) or InCopy > Preferences > Dictionary (macOS).
- 2 From the Language menu, choose the language to which the dictionary belongs.
- 3 Do any of the following:
 - To remove a dictionary from the list, select it and click the Remove User Dictionary icon . You must have at least one dictionary per language.
 - If the language dictionary includes a question mark icon next to it, select the dictionary, click the Relink User Dictionary icon , and then locate and open the user dictionary.
 - To change the order of the user dictionaries, drag and drop them. The order of the dictionaries in the list is the order in which the dictionaries are checked.

Add words to dictionaries

If, during a spell check, InDesign displays an unfamiliar word in the Check Spelling dialog box, select the dictionary from the Add To menu, and then click Add. You can also use the Dictionary dialog box to let you specify the target dictionary and language, and to indicate how words are added to an exception word list.

For stand-alone stories (stories not linked to an InDesign layout), you can add words to the language dictionaries. Customizing your dictionaries ensures that any unique vocabulary you use is recognized and treated correctly.

- 1 Choose Edit > Spelling > User Dictionary.
- 2 In the Language menu, choose a language. Each language contains at least one dictionary. If you want the word to be added to all languages, choose All Languages.
- 3 In the Target menu, choose the dictionary where you want to store the word. The Target menu lets you store the changes in an external user dictionary or in any open document.
- 4 In the Dictionary List menu, choose Added Words.
- 5 In the Word box, type or edit the word to be added to the word list.

Text

- 6 Click Hyphenate to see the word's default hyphenation. Tildes (~) indicate possible hyphenation points.
- 7 If you don't like the hyphenation points, follow these guidelines to indicate your preferred hyphenation of the word:
 - Type one tilde (~) to indicate the best possible hyphenation points, or the only acceptable hyphenation point, in the word.
 - Type two tildes (~~) to indicate your second choice.
 - Type three tildes (~~~) to indicate a poor but acceptable hyphenation point.
 - If you want the word never to be hyphenated, type a tilde before its first letter.

If you need to include an actual tilde in a word, type a backslash before the tilde (\~).

- 8 Click Add, and then click Done. The word is added to the currently selected Dictionary List.

Note: Remember that hyphenation points interact with the hyphenation settings in your documents. As a result, the word might not break where you expect it to. Control these settings by choosing Hyphenation in the Paragraph panel menu.

Remove or edit words in dictionaries

- 1 Choose Edit > Spelling > User Dictionary.
- 2 In the Language menu, choose a language.
- 3 In the Target menu, choose the dictionary from which you want to remove the word. The Target menu lets you choose an external user dictionary or any open document.
- 4 In the Dictionary List menu, do one of the following:
 - To modify the list of additions to the selected Target word list, choose Added Words.
 - To modify the list of words that are flagged as misspelled, choose Removed Words.
 - To modify the list of words that are being ignored during the current InCopy session, choose Ignored Words. This list includes all the words for which you've chosen Ignore All.
- 5 In the word list, edit the word, or select the word and click Remove.
- 6 Click Done.

Export a word list

You can export word lists to a text file (.txt) and then import that list of words into a user dictionary in InCopy. The words in the text file must be separated by a space, tab, or paragraph return. You can export added words and removed words, but you cannot export ignored words, which are used only in the current session.

- 1 Choose Edit > Spelling > User Dictionary.
- 2 Choose the language from the Language menu and the dictionary from the Target menu that contains the list of words you want to export.
- 3 Click Export, specify the file name and location, and then click Save.

The list of words is saved in a text file. You can edit this list of words in any text editor, and then import the word list. You can also send the word list to others, who can import it into their user dictionaries.

Import a word list

- 1 Choose Edit > Spelling > User Dictionary.
- 2 Choose the language from the Language menu and the dictionary from the Target menu.

Text

- 3 Click Import, locate the text file containing your list of spelling exceptions, and then click Open.

Change dictionary preferences

Use Dictionary preferences to specify how InCopy handles hyphenation and spelling dictionaries. Most languages in InCopy use Proximity dictionaries to verify spelling and to hyphenate words. If you have installed hyphenation or spelling components from a different company, you can select a different vendor for each installed language.

***Note:** The Dictionary Preferences dialog box does not enable you to specify the language dictionary used for spell checking or hyphenating text. This dialog box is used to specify which hyphenation and spelling plug-ins InCopy uses for the language specified in the Language field. If you use only the default hyphenation and spelling plug-in, you don't need to change any settings in the Dictionary Preferences dialog box. If you install a different spelling or hyphenation plug-in provided by a third-party developer, it appears as an option in the Hyphenation Vendor and Spelling Vendor menus in this dialog box. This would let you select one vendor's hyphenation or spelling engine for some languages and another vendor's hyphenation or spelling engine for other languages.*

- 1 Choose Edit > Preferences > Dictionary (Windows) or InCopy > Preferences > Dictionary (macOS).
- 2 For Language, specify the language you want to edit settings or change the hyphenation or spelling vendor.
- 3 Create, add, or remove user dictionaries.
- 4 If you have installed a hyphenation component from a company other than Adobe, select it in the Hyphenation menu.
- 5 If you have installed a spelling dictionary component from a company other than Adobe, select it in the Spelling menu.
- 6 In the Compose Using menu in the Hyphenation Exceptions menu, do one of the following:
 - To compose text using the hyphenation exceptions list stored in the external user dictionary, choose User Dictionary.
 - To compose text using the hyphenation exceptions list stored inside the document, choose Document.
 - To compose text using both lists, choose User Dictionary And Document. This is the default setting.
- 7 To add the exceptions list stored in the external user dictionary to the exceptions list stored within the document, select Merge User Dictionary Into Document.

***Note:** If you work with many different partners or clients, you might want to deselect the Merge User Dictionary Into Document option. For example, if you're a service provider, you probably don't want your user dictionary merged with every customer's file.*

- 8 To recompose all stories when certain settings are changed, select Recompose All Stories When Modified. Selecting this option recomposes stories when you change the Compose Using settings (see step 6) or when you use the Dictionary command to add or remove words. Recomposing all stories can take some time, depending on the amount of text in the document.
- 9 Click OK.

Using dictionaries in a workgroup

Make sure that each station in your workgroup has the same customized user dictionaries installed and added, so that a document uses the same spelling and hyphenation rules regardless of who is working on it. You can either make sure that everyone adds the same dictionaries to their computer, or you can share a user dictionary over the network server.

Text

A lock icon  indicates that a dictionary is locked and can be used, but not edited. When a user dictionary is stored on a server, the first user to load the dictionary locks the file; all subsequent users see that the dictionary is locked. Files can also be locked through the operating system, when the file is made read-only. If you share a user dictionary over the network server, you may want to lock the file so that it's read-only for all users, allowing only the administrator to add words.

Make sure that everyone in the workgroup uses the customized user dictionary installed on the common network workstation, and not the dictionary stored with a document. However, before you take a document to a service provider, you might want to merge the user dictionary into the document.

If you don't share a customized user dictionary on a common network workstation, locate user dictionary files and copy them from one workstation to another. The location of user dictionaries appear in the Dictionary preferences.

 *After you update a shared workstation's user dictionary, the changes don't appear in individual workstations until a user restarts InCopy or presses Ctrl+Alt+/ (Windows) or Command+ Option+/ (macOS) to recompose all text.*

Assign a language dictionary to selected text

If you use more than one language in a stand-alone story (stories not linked to an InDesign layout), you can tell InCopy which language dictionary to use for spell checking and hyphenating words in a particular language. You can assign different language dictionaries to the various parts of your document down to a single character of text.

A Glockenspiel in English B Glockenspiel in Traditional German C Glockenspiel in Reformed German

- 1 Select the text to which you want to assign a dictionary.
- 2 Choose Type > Character to open the Character panel.
- 3 At the bottom of the Character panel, choose a dictionary from the Language menu. (If the Language menu doesn't appear in the Character panel, choose Customize from the Character panel menu, select Language, and click OK.)

Note: *If the InCopy story is linked to an InDesign layout with an embedded hyphenation list, the embedded list governs spell checking and hyphenation.*

Cross-references

If you're writing a manual or reference document, you may want to include a cross-reference to refer the reader from one part of your document to another. Example: For more information, see "Field mice" on page 249. You can specify whether a cross-reference derives from a paragraph style, such as a heading style, or from a text anchor you've created. You can also determine the cross-reference format, such as Page Number Only or Full Paragraph & Page Number.

Insert cross-references

Use the Hyperlinks panel to insert cross-references into your document. The text being referred to is the *destination text*. The text that is generated from the destination text is the *source cross-reference*.

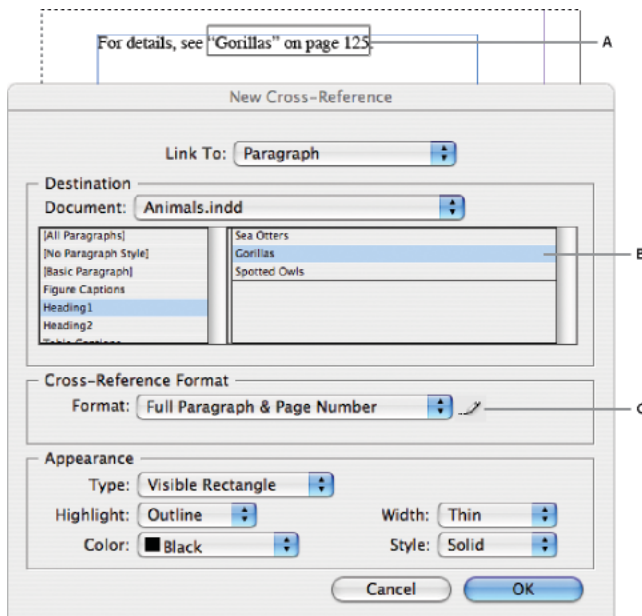

Text

When you insert a cross-reference in your document, you can choose from several predefined formats, or you can create your own custom format. You can apply a character style to the entire cross-reference source, or to text within the cross-reference. Cross-reference formats can be synchronized across a book.

Cross-reference source text is editable and can break across lines.

Note: Cross-references are included in exported Adobe PDF files if *Hyperlinks* is selected in the *Export Adobe PDF* dialog box in *InDesign*.

In *InCopy* standalone documents, you can create and edit cross-references as you can in *InDesign*. In checked-out stories, you can create and edit cross-references to paragraphs in the same story as the source, to paragraphs in another checked-out story if the *InDesign* document is open, or to text anchors in any story of any *InDesign* document.

A Cross-reference source in document B Selected destination paragraph C Click here to create or edit cross-reference format.

- 1 Place the insertion point where you want the cross-reference to be inserted.
- 2 Do any of the following:
 - Choose **Type > Hyperlinks & Cross-References > Insert Cross-Reference**.
 - Choose **Window > Type & Tables > Cross-References**, and then choose **Insert Cross-Reference** from the **Hyperlinks** panel menu.
 - Click the **Create New Cross-Reference** button  in the **Hyperlinks** panel.
- 3 In the **New Cross-Reference** dialog box, choose **Paragraph** or **Text Anchor** from the **Link To** menu.

If you choose **Paragraph**, you can create a cross-reference to any paragraph in the document you specify.

If you choose **Text Anchor**, you can create a cross-reference to any text in which you have created a hyperlink destination. Creating a text anchor is especially useful if you want to use different text than the actual destination paragraph.

Text

- 4 For Document, select the document containing the destination that you want to refer to. All open documents that have been saved are listed in the pop-up menu. If the document you're looking for isn't open, choose Browse, locate the file, and then click Open.
- 5 Click a paragraph style (such as Head1) in the left box to narrow down the choices, and then select the paragraph you want to refer to. (Or, if Text Anchor is selected, choose the text anchor.)
- 6 Choose the cross-reference format you want to use from the Format menu.
You can edit these cross-reference formats or create your own.
- 7 Specify the appearance of the source hyperlink.
- 8 Click OK.

When you insert a cross-reference, a text anchor marker  appears at the beginning of the destination paragraph. You can view this marker when you choose Type > Show Hidden Characters. If this marker is moved or deleted, the cross-reference becomes unresolved.

Using cross-reference formats

Several cross-reference formats appear in the New Cross-Reference dialog box by default. You can edit these formats, delete them, or create your own.

Note: If you've deleted or edited cross-reference formats in your document and want to return them to the default formats, you can choose Load Cross-Reference Formats from the panel menu and choose a document with unedited formats. You can also synchronize cross-reference formats in a book.

Create or edit cross-reference formats

Unlike other presets, cross-reference formats can be edited or deleted. When you edit a cross-reference format, any source cross-reference that uses that format is automatically updated.

In InCopy, you can create or edit cross-reference formats only in stand-alone documents. In assignment files, the cross-reference formats are determined by the InDesign document.

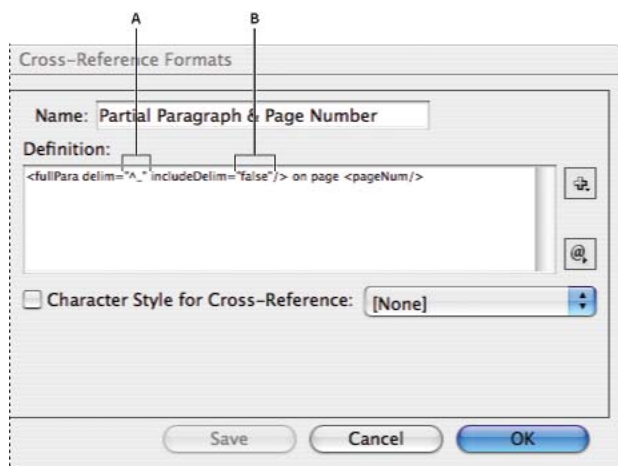

- 1 Do any of the following:
 - Choose Define Cross-Reference Formats from the Hyperlinks panel menu.
 - While creating or editing a cross-reference, click the Create Or Edit Cross-Reference Formats button .
- 2 In the Cross-Reference Formats dialog box, do one of the following:
 - To edit a format, select the format on the left.
 - To create a format, select a format to base the new format on, and then click the Create Format button . This creates a duplicate of the selected format.
- 3 For Name, specify the name of the format.
- 4 In the Definition text box, add or remove any text as needed. Click the Building Block icon  to insert building blocks from a menu. Click the Special Characters icon  to select dashes, spaces, quotation marks, and other special characters.
- 5 To apply a character style to the entire cross-reference, select Character Style For Cross-Reference, and then choose or create the character style from the menu.
You can also use the Character Style building block to apply a character style to text within the cross-reference.
- 6 Click Save to save the changes. Click OK when finished.

Cross-reference building blocks

Building block	What it does	Example
Page Number	Inserts the page number.	on page <pageNum/> on page 23
Paragraph Number	Inserts the paragraph number in a cross-reference to a numbered list.	See <paraNum/> See 1 In this example, only "1" is used from the paragraph, "1. Animals."
Paragraph Text	Inserts the paragraph text without the paragraph number in a cross-reference to a numbered list.	See "<paraText/>" See "Animals" In this example, only "Animals" is used from the paragraph, "1. Animals."
Full Paragraph	Inserts the entire paragraph, including paragraph number and paragraph text.	See "<fullPara/>" See "1. Animals"
Partial Paragraph	Lets you create a cross-reference to the first part of a paragraph, up to the specified delimiter, such as a colon or em dash.	See <fullPara delim=":" includeDelim="false"/> See Chapter 7 In this example, only "Chapter 7" is used from the title "Chapter 7: Dogs and Cats." Specify the delimiter (such as : in this example), and indicate whether the delimiter is excluded ("false" or "0") or included ("true" or "1") in the source cross-reference.
Text Anchor Name	Inserts the text anchor name. You can create text anchors by choosing New Hyperlink Destination from the Hyperlinks panel menu.	See <txtAnchrName/> See Figure 1
Chapter Number	Inserts the chapter number.	in chapter <chapNum/> in chapter 3
File Name	Inserts the filename of the destination document.	in <fileName/> in newsletter.indd
Character Style	Applies a character style to text within a cross-reference.	See <cs name="bold"><fullPara/></cs> on page <pageNum/> See Animals on page 23. Specify the character style name, and include the text you want to apply the character style to between the <cs name=""> and </cs> tags.

Creating cross-references to partial paragraphs

You can design cross-reference formats to include only the first part of a paragraph. For example, if you have headings in your document that look like, “Chapter 7—Granada to Barcelona,” you can create a cross-reference that refers only to “Chapter 7.”

A The cross-reference source ends at an em dash (^_) B “false” excludes the em dash from the source

When you insert the Partial Paragraph building block, you must do two things. First, specify the delimiter between the quotation marks. The delimiter is the character that ends the paragraph. Common delimiters include colons (Chapter 7: Granada), periods (Chapter 7. Granada), and dashes (Chapter 7—Granada). To insert special characters such as em dashes (^_), em spaces (^m), and bullet characters (^8), choose an option from the menu that appears when you click the Special Characters icon.

Second, indicate whether the delimiter character is excluded (Chapter 7) or included (Chapter 7—). Use `includeDelim="false"` to exclude the delimiter and `includeDelim="true"` to include the delimiter. Instead of “false” or “true,” you can use “0” or “1,” respectively.

Apply character styles within a cross-reference

If you want to emphasize a section of text within a cross-reference, you can use the Character Style building block. This building block consists of two tags. The `<cs name="stylename">` tag indicates which style is applied, and the `</cs>` tag ends the character style. Any text or building blocks between these tags is formatted in the specified style.

Text

A This tag applies a character style named "Red." B This tag ends the character style formatting. C A character style named "Bold" is applied to the rest of the cross-reference source.

- 1 Create the character style you want to use.
- 2 In the Cross-Reference Formats dialog box, create or edit the format you want to apply.
- 3 Under Definition, select the text and building blocks to which you want to apply the character style.
- 4 Choose Character Style from the menu to the right of the definition list.
- 5 Type the name of the character style between the quotation marks exactly as it appears in the Character Styles panel. Style names are case sensitive. If the character style is in a group, type the name of the group followed by a colon before the character style, such as Style Group 1: Red.
- 6 Click Save to save the format, and then click OK.

Load (import) cross-reference formats

When you load cross-reference formats from another document, the incoming formats replace any existing formats that share the same name.

In InCopy, you can import cross-reference formats only in standalone documents. You cannot import formats from an InCopy document into an InDesign document. If the new or modified format in InCopy conflicts with a format in the InDesign document when the story is checked in, the InDesign format takes precedence.

- 1 Choose Load Cross-Reference Formats from the Hyperlinks panel menu.
- 2 Double-click the document containing the cross-reference formats you want to import.

You can also share cross-reference formats across documents by synchronizing a book.

Delete cross-reference formats

You cannot delete a cross-reference format that has been applied to cross-references in the document.

- 1 In the Cross-Reference Formats dialog box, select the format you want to delete.
- 2 Click the Delete Format button .

Manage cross-references

When you insert a cross-reference, the Hyperlinks panel indicates the status of the cross-reference. For example, icons indicate if the destination text appears on the pasteboard **PB**, a master page **MP**, a hidden layer **HL**, in overset text **OV**, or in hidden text **HT**. Cross-references that link to such destination areas are *unresolved*. The panel also lets you know if the destination paragraph has been edited  (also called *out-of-date*) or is missing . Destination text is *missing* if either the destination text or the file containing the destination text cannot be found. Hold the mouse pointer over any icon to view a tool tip description.

In InCopy, you can manage cross-references only if the story is checked out for editing.

Update cross-references

An update icon indicates that the cross-reference destination text has changed or that the cross-reference source text has been edited. You can easily update the cross-reference. If the destination moves to a different page, the cross-reference is updated automatically.

When you update a cross-reference, any formatting changes you've made to the source text are removed.

When printing or outputting, you are notified if cross-references are out of date or unresolved.

You can also use the Preflight panel to notify you when cross-references are out of date or unresolved. When defining a profile, select Cross-References in the Text section.

- 1 Select one or more out-of-date cross-references. To update all cross-references, make sure that none are selected.
- 2 Do any of the following:
 - Click the Update Cross-References button  in the Hyperlinks panel.
 - Choose Update Cross-Reference from the Hyperlinks panel menu.
 - Choose Type > Hyperlinks & Cross-References > Update Cross-Reference.

To update all cross-references in a book, choose Update All Cross-References from the book panel menu. You are notified if any cross-references remain unresolved.

Relink cross-references

If the missing destination text has been moved to a different document, or if the document containing the destination text is renamed, you can relink the cross-reference. When you relink, any changes made to the source cross-reference are removed.

- 1 In the Cross-References section of the Hyperlinks panel, select the cross-reference you want to relink.
- 2 Choose Relink Cross-Reference from the Hyperlinks panel menu.
- 3 Locate the document in which the destination text appears, and then click Open.

If any other destination text appears in that document, you can relink additional cross-references.

Edit cross-references

To change the appearance of the source cross-reference or specify a different format, you can edit the cross-reference. If you edit a cross-reference that links to a different document, the document is opened automatically.

- 1 Do any of the following:
 - Choose Type > Hyperlinks & Cross References > Cross-Reference Options.
 - In the Cross-References section of the Hyperlinks panel, double-click the cross-reference you want to edit.
 - Select the cross-reference, and choose Cross-Reference Options from the Hyperlinks panel menu.

Text

- 2 Edit the cross-reference, and then click OK.

Delete cross-references

When you delete a cross-reference, the source cross-reference is converted to text.

- 1 In the Cross-References section of the Hyperlinks panel, select the cross-reference or cross-references you want to delete.
- 2 Click the Delete icon, or choose Delete Hyperlink/Cross-Reference from the panel menu.
- 3 Click Yes to confirm.

To completely remove a cross-reference, you can also select the cross-reference source and delete it.

Editing cross-reference source text

You can edit cross-reference source text. The advantage of editing cross-reference text is that you can change tracking or word spacing as needed for copyfitting, or make other changes. The disadvantage is that if you update or relink the cross-reference, any local formatting changes are removed.

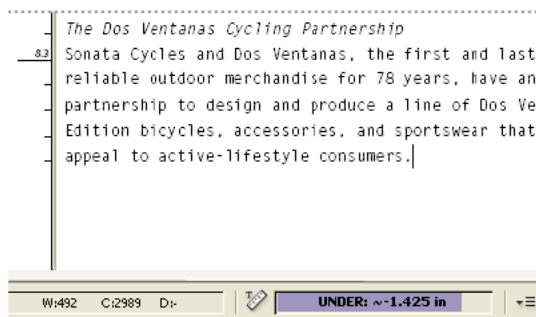

Copyfitting text

Copyfitting text

InCopy keeps track of several text statistics and makes this data available in the Copyfit Info toolbar. As you write your story, the Copyfit Info toolbar automatically displays the number of lines, words, and characters, and the vertical depth at the bottom of the work area for both linked and stand-alone stories in Galley and Layout views.

Note: You can make the Copyfit Info toolbar a floating panel.

For linked InCopy documents or for stand-alone documents with a Depth setting, the Copyfit Progress Info box indicates the precise amount by which a story is too long or too short. If the story doesn't fill the frames assigned to it, the copyfit box turns blue and displays a count. The length of the blue bar indicates roughly what percentage of the frame is currently filled with text. The shorter the blue bar, the more text you need to add to fill the space.

If the text overflows the assigned frame space, a copyfit line indicates where overset text begins, and the Copyfit Progress Info box turns red and displays the amount you need to cut to fit copy into the frame.

Note: The red bar is always the same length. It does not reflect any percentage of the space available.

Text

The Copyfit Info toolbar also includes options for displaying the number of lines, words, and characters, and the vertical depth in the current selection, from the beginning of the current story to the current insertion point, or from the current insertion point to the end of the current story.

When you show hidden characters (choose Type > Show Hidden Characters), InCopy displays a number sign (#) at the end of the last character to indicate the end of the text flow for a story.

Customize Copyfit Info settings

- To add Copyfit Info controls, click the triangle on the right side of the Copyfit Info toolbar, choose Customize, select which items you want to appear in the toolbar, and then click OK.
- To include footnote text in statistics, choose Include Footnotes In Text Statistics from the Copyfit Info toolbar menu.
- To define word count based on a specified number of characters rather than actual words, choose Define Word Count from the Copyfit Info toolbar menu, select Count Every, specify the number of characters, and click OK.
- To stop updating statistics while typing, turn off Update Info Automatically from the Copyfit Info toolbar menu.
- To display additional statistics such as kanji, kana, and romanji characters, choose Show Details from the Copyfit Info toolbar menu.

Editing overset text

If a story is linked to an InDesign layout, the story is limited to the frames the designer specifies. If you specified a Depth setting when creating a stand-alone InCopy document, the story is limited to that depth. When you type more than the allowed length of text, the text is *overset*. When the story is *underset*, there is space available to be filled with text. As you write and edit, you can tell when your story fits perfectly into the InDesign layout. You can still edit overset text.

In Galley view or Story view, overset text is set apart from the rest of the story by a *copyfit break* line. You use the same procedures to write and edit the text, whether it is above or below the copyfit break line.

In Layout view, overset text is not visible, but the Copyfit Progress Info box indicates the number of overset lines.

If you're writing or editing a threaded story in Layout view, you don't need to do anything special when you reach the end of a frame. The insertion point automatically follows the story thread from frame to frame as you type.

Show or hide the depth ruler

In Galley or Story view, choose View > Show Depth Ruler or Hide Depth Ruler. To change the units of measurement used for the depth ruler, change the Vertical setting in Units & Increments Preferences.

Editing text

Select text

Using the Type tool, do one of the following:

- Drag the I-bar cursor over a character, word, or an entire text block to select it.
- Double-click a word to select it. Spaces next to the word are not selected.
- Double-click a character to select contiguous characters of the same type. For example, when Roman text, kanji, and hiragana all appear in a paragraph, and you double-click on a kanji, the adjoining kanji in the same string will be selected.
- Triple-click anywhere in a line to select a line. If the Triple Click To Select A Line preferences option is deselected, triple-clicking selects the entire paragraph.
- If the Triple Click To Select A Line option is selected, quadruple-click anywhere in a paragraph to select the entire paragraph.
- Quintuple-click to select the entire story, or click anywhere in a story and choose Edit > Select All.

Note: If you select text that contains a note anchor, using any of the above procedures, the note and its contents are also selected.

If you cannot select text in a frame, the text frame could be on a locked layer or on a master page. Try unlocking the layer or going to the master page. The text frame may also be beneath another text frame or transparent object.

Change what triple-clicking does

- 1 Choose Edit > Preferences > Type (Windows) or InCopy > Preferences > Type (macOS).
- 2 Select Triple Click To Select A Line to enable triple-clicking to select a line (this is the default). Deselect this option if you want triple-clicking to select a paragraph.

Select text in a frame that is covered

- 1 Using the Selection tool , hold down Ctrl (Windows) or Command (macOS) and click to select the text frame.
- 2 Select the Type tool, and then click inside the text frame or select text.

Paste text

You can paste text from another application or from Adobe InCopy.

If the insertion point is not inside a text frame when you paste text into InDesign, a new plain text frame will be created. If the insertion point is inside a text frame, the text will be pasted inside that frame. If you have text selected when you paste, the pasted text will overwrite the selected text.

Text

When you use Edit > Paste Without Grid Format to paste text into a frame grid, the pasted text retains its font, font size, and character spacing settings of the copied text. You can select text and choose Edit > Apply Grid Format to format the pasted text according to the character attributes of the frame grid.

Paste text from another application

- 1 To preserve formatting and information such as styles and index markers, open the Clipboard Handling section of the Preferences dialog box, and select All Information under Paste. To remove these items and other formatting when pasting, select Text Only.
- 2 Cut or copy text in another application or in an InCopy document.
- 3 If you like, select text or click in a text frame. Otherwise, the text will be pasted into its own new frame.
- 4 Do one of the following:
 - Choose Edit > Paste. If the pasted text doesn't include all the formatting, you may need to change settings in the Import Options dialog box for RTF documents.
 - Choose Edit > Paste Without Formatting. (Paste Without Formatting is dimmed if you paste text from another application when Text Only is selected in Clipboard Handling Preferences.)
 - Choose Edit > Paste Without Grid Format.

 You can also drag text from another application and drop it into an InDesign document, or you can insert a text file or word-processing file into an InDesign document directly from Windows Explorer or macOS Finder. The text will be added to a new frame. Shift-dragging removes the formatting. The option you select in the Clipboard Handling section of the Preferences dialog box determines whether information such as index markers and swatches is preserved.

Adjust spacing automatically when pasting text

When you paste text, spaces can be automatically added or removed, depending on the context. For example, if you cut a word and then paste it between two words, a space appears before and after the word. If you paste that word at the end of a sentence, before the period, a space is not added.

Note: This feature is used primarily for working with Roman text. Also, this feature is available only when the Roman text to be pasted is set to a Roman language in the Character panel.

- 1 Choose Edit > Preferences > Type (Windows) or InCopy > Preferences > Type (macOS).
- 2 Select Adjust Spacing Automatically When Cutting And Pasting Words, and then click OK.

Paste text to a frame grid

You can paste text that retains its source formatting attributes. When you copy text with modified attributes from one frame grid and paste to a different frame grid, the text will be pasted with only those changed attributes preserved. You can also paste without grid formatting.

- 1 Cut or copy text in another application or in an InCopy document.
- 2 In the frame grid, display the text insertion point or select a block of text.
- 3 Do one of the following:
 - To paste text that conforms to the grid format, choose Edit > Paste.
 - To paste text without grid formatting, choose Edit > Paste Without Grid Format.

You can always apply grid formatting later by choosing Edit > Apply Grid Format. The grid format attributes specified in the Named Grids panel will be applied to the text.

Apply grid format to text

You can apply the grid format to any text that doesn't conform to the grid format.

- 1 Select the text.
- 2 Choose Edit > Apply Grid Format.

Change the text direction

- 1 Select the text frame.
- 2 Do either of the following:
 - Choose Type > Writing Direction > Horizontal or Vertical.
 - Choose Type > Story to show the Story panel. Select Horizontal or Vertical for Story Direction.

In Galley view and Story view, text appears as horizontal, even if Vertical is selected. In Layout View, text is vertical if Vertical is selected.

A vertical text frame or frame grid is converted to a horizontal one, or a horizontal text frame or frame grid is converted to a vertical one. Changing this causes the entire story to be changed, and all frames threaded to the selected frames will be affected.

***Note:** To change the direction of individual characters in a frame, use the Tate-chu-yoko feature, or use the Character Rotation feature in the Character panel.*

Drag and drop text

You can use the mouse to drag and drop text in the Story Editor or in the Layout View. You can even drag text from the Story Editor to the layout window (or vice versa), or into some dialog boxes such as Find/Change. Dragging the text from a locked or checked-in story copies the text rather than moves it. You can also copy text or create a new frame when dragging and dropping text.

You can use the mouse to drag and drop text in Galley View, Story View, or Layout View. You can even drag text into some dialog boxes, such as Find/Change. Dragging text from a locked or checked-in story copies the text rather than moves it. You can also copy text when dragging.

- 1 To enable drag and drop, choose Edit > Preferences > Type (Windows) or InCopy > Preferences > Type (macOS), select Enable In Layout View, Enable In Story Editor (InDesign), or Enable In Galley/Story View (InCopy), and then click OK.
- 2 Select the text that you want to move or copy.
- 3 Hold the pointer over the selected text until the drag and drop icon  appears, and then drag the text.

As you drag, the selected text remains in place, but a vertical bar indicates where the text will appear when you release the mouse button. The vertical bar appears in any text frame that you drag the mouse over.

- 4 Do any of the following:
 - To drop the text in a new location, position the vertical bar where you would like the text to appear and release the mouse button.
 - To drop the text in a new frame, hold down Ctrl (Windows) or Command (macOS) after you start dragging, and then release the mouse button before releasing the key.

Text

- To drop the text without formatting, hold down Shift after you start dragging, and then release the mouse button before releasing the key.
- To copy the text, hold down Alt (Windows) or Option (macOS) after you start dragging, and then release the mouse button before releasing the key.

 You can also use a combination of these modifier keys. For example, to copy unformatted text to a new frame, hold down Alt+Shift+Ctrl (Windows) or Option+Shift+Command (macOS) after you start dragging.

If the text you drop doesn't have the proper spacing, select the Adjust Spacing Automatically option in Type Preferences.

Transpose characters

If you transpose two adjacent characters as you type, you can correct them with the Transpose command. For example, if you typed 1243 instead of 1234, the Transpose command switches the 4 and the 3.

- 1 Place the insertion point between the two characters you want to transpose.
- 2 Choose Edit > Transpose.

Note: The Transpose command applies only to characters and numbers within stories. It cannot move InCopy note anchors, tables, spaces, or other nonprinting characters. You cannot use Transpose in a locked story.

View hidden characters

When you're editing text, it's often useful to see nonprinting characters, such as spaces, tabs, and paragraph symbols. These characters are visible only in a document window; they won't output or print.

Growth in production of custom hand-made guitars by year:		
1996	1997	1998
12	36	89

Growth in production of custom hand-made guitars by year:¶		
» 1996	» 1997	» 1998 ¶
» 12	» 36	» 89#

Do one of the following:

- Choose Type > Show Hidden Characters. A check mark appears next to the menu command.
- Click the Show Hidden Characters button ¶ on the horizontal toolbar.

Edit text on a master page

In InDesign documents, a master page is a kind of template that applies to multiple pages. Master pages typically specify only common layout elements that appear on all pages of the document, such as the margins, page numbers, headers, and footers. You can use InCopy to edit the text on an InDesign master page if the text is a linked file. However, you cannot change any of the frame attributes controlled by the master, and you cannot edit master-page text from any other (regular) pages in the document.

Text

Note: If you can't click an insertion point into a nonlocked text frame on a regular page, that text might be on a master page. Check with the person who set up the frames and with your design team.

- 1 Choose View > Layout View if your document is not already in Layout view.
- 2 Choose the master page from the page box at the lower left of the document window.

- 3 On the master page, select the text that you want to edit, and make the changes.

To edit text on a master page, the master page must include managed stories that are checked out.

Undo actions

You can undo or redo up to several hundred of the most recent actions. The exact number of actions you can undo is limited by the amount of RAM available and the kinds of actions you have performed. The record of recent actions is erased when you save, close, quit, or exit, so they can no longer be undone. You can also cancel an operation before it completes, or revert to a previously saved version.

Do one of the following:

- To undo the most recent change, choose Edit > Undo [action]. (You cannot undo certain actions, such as scrolling.)
- To redo an action you just undid, choose Edit > Redo [action].
- To undo all changes made since the last time you saved the project, choose File > Revert Content.
- To stop a change that InCopy hasn't finished processing (for example, if you see a progress bar), press Escape key.
- To close a dialog box without applying changes, click Cancel.

Jump to a position marker

A *position marker* is like a bookmark, and it is used to mark a location in a document. This is useful if you need to return to that location quickly or frequently. A document can have only one position marker.

- 1 Place the insertion point where you want to insert the marker.
- 2 Choose Edit > Position Marker > Insert Marker. (If you've already inserted a marker, choose Replace Marker.)

To jump to the marker from anywhere in the document, choose Edit > Position Marker > Go To Marker.

To clear the marker, choose Edit > Position Marker > Remove Marker. The marker is removed automatically when you close and reopen the document.

Add column, frame, and page breaks

Control column, frame, and page breaks by inserting special break characters in the text.

- 1 Using the Type tool, click to place the insertion point where you want the break to occur.
- 2 Choose Type > Insert Break Character, and then choose a break option from the submenu.

Text

 You can also create breaks by using the Enter key on the numeric keypad. For a column break, press Enter; for a frame break, press Shift+Enter; and for a page break, press Ctrl+Enter (Windows) or Command+Return (macOS).

To remove a break character, choose Type > Show Hidden Characters so that you can see nonprinting characters, and then select and delete the break character.

Note: If you create a break by changing paragraph settings (Keep Options), the break precedes the paragraph that contains the setting. If you create a break using a special character, the break occurs after the special character.

Break options

The following options appear on the Type > Insert Break Character menu:

Column break

Flows text to the next column in the current text frame. If the frame has only one column, the text goes to the next threaded frame.

Frame break

Flows text to the next threaded text frame, regardless of the current text frame's column setup.

Page break

Flows text to the next page with a text frame threaded to the current text frame.

Odd page break

Flows text to the next odd-numbered page with a text frame threaded to the current text frame.

Even page break

Flows text to the next even-numbered page with a text frame threaded to the current text frame.

Paragraph Return

Inserts a paragraph return (the same as pressing Enter or Return).

Forced Line Break

Forces a line to break where the character is inserted, starting a new line without starting a new paragraph (the same as pressing Shift+Enter or Shift+Return). A forced line break is also called a soft return.

Discretionary Line Break

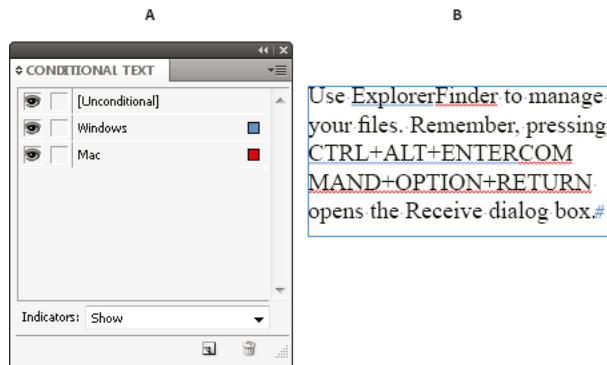

Indicates where a line of text should break if the line needs to break. A discretionary line break is similar to a discretionary hyphen, only no hyphen is added where the line breaks.

Related break options are available in the Keep Options dialog box and in the Paragraph Style Options dialog box.

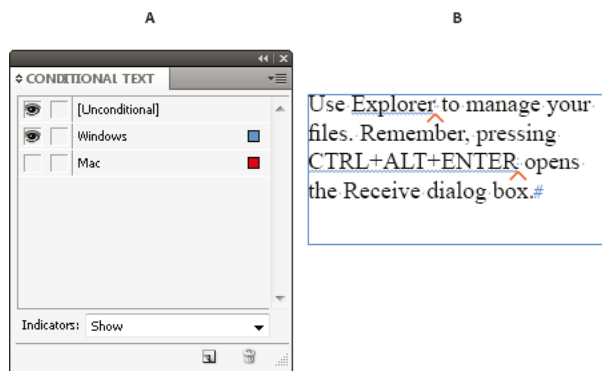

Use conditional text

Conditional text is a way to create different versions of the same document. After you create conditions, you apply them to ranges of text. You can then create different versions of documents by showing and hiding conditions. For example, if you're creating a computer manual, you can create separate conditions for macOS and Windows. Before you print the macOS version of the user guide, you can show all text to which the "Mac" condition is applied and hide all text to which the "Windows" condition is applied. You can then reverse the condition states for printing the user guide for Windows.

Text

A All conditions shown B Conditional indicators

A "Mac" condition hidden B Hidden condition symbols

Conditions can be applied only to text. You can make anchored objects conditional, but only by selecting the anchored object marker. You can apply conditions to text within table cells, but you cannot apply conditions to table cells, columns, or rows. You cannot apply conditions to text in locked InCopy stories.

Planning conditional documents

When planning a project with conditional text, examine the nature of the material and look at how several people can take turns working with it if the document is handed off. Plan to treat conditional text consistently to make the document easier to use and maintain. Use the following guidelines.

Number of versions Define how many versions your finished project will contain. For example, if you're creating a manual that describes a program that runs on both Windows and macOS platforms, you might want to produce at least two versions: a Windows version and a macOS version. If you want to produce these versions with editorial comments sprinkled in the text during the review process, you'll want even more versions: macOS with comments, macOS without comments, Windows with comments, and Windows without comments.

For documents with many conditions, you can define condition sets that can be applied to the document for quick versioning.

Number of condition tags required Decide how many condition tags you need to produce the desired versions. A version of a document is defined by a unique set of condition tags. For example, a version of a finished Windows manual might be defined by having a Windows condition tag showing, a macOS condition tag hidden, and a Comments condition tag hidden. In this example, you would need to decide whether to use one condition tag for Windows comments and another for macOS comments, or whether to use a single condition tag for both Windows and macOS comments.

Text

Organization of content Evaluate the extent to which the document can be conditional and how you can organize the material to simplify development and maintenance. For example, you might be able to organize a book so that conditional text is limited to a few documents. Or you might choose to keep versions of a particular chapter in separate files rather than in conditional text, and then use a different book file for each version of the book.

In some instances, such as when working with multiple languages, you may want to create separate layers that you can show or hide rather than using conditions, with each layer including text from a different language.

Tagging strategy Determine the smallest unit of conditional text. For example, if a document will be translated to another language, a whole sentence should be the smallest amount of text you make conditional. Because word order often changes during translation, using conditional text for part of a sentence could complicate translation.

Inconsistency in applying conditions to spaces and punctuation can result in extra spacing or misspelled words. Decide whether to make spaces and punctuation conditional. If conditional text begins or ends with punctuation, make the punctuation conditional too. This makes the text easier to read when you're viewing more than one version.

To avoid word spacing problems, such as having an unconditional space followed by a conditional space, set standards for handling spaces following conditional text (either always conditional or always unconditional).

To avoid confusion, decide the order in which conditional text will appear and use this order throughout the document.

Indexes and cross-references When indexing a document, pay attention to whether index markers are placed inside or outside conditional text. Keep in mind that index markers in hidden conditional text are not included in the generated index.

If you create a cross-reference to conditional text, make sure that the source text has the same condition. For example, if you add a cross-reference in a “Windows” paragraph and the text anchor appears in a “Mac” condition, the cross-reference is unresolved when the “Mac” condition is hidden. “HT” appears next to the cross-reference in the Hyperlinks panel.

If you create a cross-reference to a paragraph in which some text is conditional and then change the visibility settings of that condition, update the cross-reference.

Create conditions

Conditions you create are saved in the current document. If no documents are open when you create a condition, that condition appears in all new documents you create.

You can make conditional text easy to identify by specifying condition *indicators*, such as wavy red underlines.

In managed InCopy files, you can apply existing conditions, but you cannot create or delete conditions. You can hide or show conditional text in InCopy, but the changes do not appear in InDesign when the managed file is checked in. In InCopy standalone documents, you can create, apply, and change the visibility of conditions as in InDesign.

- 1 Choose Window > Type & Tables > Conditional Text to display the Conditional Text panel.
- 2 Choose New Condition from the Conditional Text panel menu, and type a name for the condition.
- 3 In the Indicator group, specify the appearance of the indicator to which the condition is applied.

By default, indicators (such as wavy red lines) are set to appear in the document but not be printed or output. You can choose an option from the Indicators menu in the Conditional Text panel to hide indicators or to print and output them, which can be useful for review purposes.

- 4 Click OK.

Apply conditions to text

You can apply multiple conditions to the same text. By default, condition indicators identify conditional text. However, if indicators are hidden, you can use the Conditional Text panel to determine which conditions have been applied to the current text. A solid check mark indicates the condition is applied to the current text. A dim check mark indicates that the condition is applied only to part of the selection.

- 1 Select the text to which you want to apply the condition.
- 2 In the Conditional Text panel (Windows > Type & Tables > Conditional Text), do any of the following:
 - To apply a condition, click the condition, or click the box next to the condition name.
 - To apply a condition and remove other conditions applied to the text, Alt-click (Windows) or Option-click (macOS) a condition.
 - To remove a condition, click the box next to the condition name to remove the check mark. Or, click [Unconditional] to remove all conditions from the selected text.

Note: You cannot apply keyboard shortcuts to specific conditions. However, you can apply conditions using Quick Apply.

Show or hide conditions

When you hide a condition, all text to which that condition is applied is hidden. Hiding conditions often causes the page numbering to change in a document or book. You can use the Smart Text Reflow feature to add and remove pages automatically as you hide and show conditions.

Hidden conditional text is generally ignored in the document. For example, hidden text is not printed or exported, index markers in hidden conditional text are not included in a generated index, and hidden conditional text is not included when searching or spell-checking text.

When you hide a condition, the hidden text is stored in a hidden condition symbol . If you select text that contains a hidden condition symbol and try to delete it, InCopy prompts you to confirm that you want to delete the hidden conditional text. You cannot apply other conditions, styles, or formatting to hidden conditional text.

If text has several conditions applied to it and at least one of those conditions is shown while another is hidden, the text is not hidden.

- To show or hide individual conditions, click the visibility box next to a condition name. The eye icon indicates the condition is shown.
- To show or hide all conditions, choose Show All or Hide All from the Conditional Text panel menu.

Use condition sets

A condition set captures the visibility settings for all conditions so that you can quickly apply different document renditions. For example, suppose you have a complex document with platform conditions for macOS, Windows, UNIX, language conditions for English, French, German, and Spanish, and editorial conditions such as Editorial Review and Internal Comments. For reviewing the other version in French, you can create a set that shows only the French, and Editorial Review conditions, and hides all the rest.

While sets aren't necessary to do this, they help you quickly and reliably change different condition visibility settings.

- 1 Apply conditions to text as necessary.
- 2 If the Set menu doesn't appear in the Conditional Text panel, choose Show Options from the Conditional Text panel menu.
- 3 In the Conditional Text panel, make the conditions visible or hidden as needed.
- 4 Choose Create New Set from the Set menu, specify a name for the set, and click OK.

Text

The new set becomes the active set.

5 Do any of the following:

- To apply the condition set to a document, choose the condition set name from the Set menu.
- To override a condition set, select the set to make it active, and change the visibility setting of any condition. A plus sign (+) appears next to the condition set. Choose the condition set again to remove overrides. Choose Redefine “[Condition Set]” to update the condition set with the new visibility settings.
- To delete a condition set, select the condition set, and then choose Delete “[Condition Set].” Deleting a condition set does not delete the set’s conditions, nor does it remove the conditions from wherever they are applied.

Manage conditions

Do any of the following:

Delete a condition Select a condition and click the Delete Condition icon at the bottom of the Conditional Text panel. Specify a condition to replace the deleted condition and click OK. The condition you specify is applied to all text to which the deleted condition was applied.

To delete multiple conditions, Shift-click to select contiguous conditions, or Ctrl-click (Windows) or Command-click (macOS) to select non-contiguous conditions, and then click the Delete Condition icon.

Remove a condition from text Removing a condition tag from text is different from deleting a tag from a document. When you remove a tag from text, the tag remains in the document so it can be applied again later.

To remove a condition from text, select the text and click the box next to the condition to remove the check mark, or click [Unconditional] to remove all conditions from the selected text.

Load (import) conditions Choose Load Conditions (to load only conditions) or Load Conditions And Sets from the Conditional Text panel menu. Select the InDesign document from which you want to import the conditions, and click Open. Loaded conditions and sets replace any condition or set that has an identical name.

You cannot load conditions from an InCopy file in InDesign, but you can load conditions from an InDesign file in both InDesign and InCopy.

Loaded sets ignore the visibility settings of the conditions currently in the Conditional Text panel.

Synchronize conditions in a book To make sure you’re using the same conditions in all documents in a book, create the conditions you want in the style source document, select Conditional Text Settings in the Synchronize Options dialog box, and then synchronize the book.

Show or hide condition indicators Choose Show or Hide from the Indicators menu in the Conditional Text panel to show or hide condition indicators. If you’re showing one version and want to see which areas are conditional, show the condition indicators. If you find the condition indicators distracting while viewing the layout, hide the condition indicators. Choose Show And Print if you want the condition indicators to be printed and output.

Change a condition name In the Conditional Text panel, click a condition, pause, and then click the condition name to select it. Type a different name.

Edit condition indicators In the Conditional Text panel, double-click a condition, or select a condition and choose Condition Options from the panel menu. Specify indicator settings, and click OK.

Find and change conditional text

Use the Find/Change dialog box to find text to which one or more conditions have been applied and replace it with one or more other conditions.

- 1 Show any conditional text you want included in the search.

Hidden text is excluded from the search.

- 2 Choose Edit > Find/Change.
- 3 If the Find Format and Change Format boxes don't appear at the bottom of the dialog box, click More Options.
- 4 Click the Find Format box to display the Find Format Settings dialog box. Under Conditions, select [Any Condition] to search for text in which any condition is applied, [Unconditional] to search for text in which no condition is applied, or select the specific condition or conditions you want to search for. Click OK.

This feature finds text that perfectly matches the selected conditions. For example, if you select both Condition 1 and Condition 2, text to which only one of the conditions are applied isn't found, nor is text found to which these two conditions and another is applied.

- 5 Click the Change Format box to display the Change Format Settings dialog box. Specify the different formatting option, such as a condition or a character style, and then click OK.

If you select the Conditions section in the Change Format Settings dialog box, the [Any Condition] makes no changes to the found conditional text. This option is useful if you want to apply different formatting, such as a character style. Select [Unconditional] to remove all conditions from the found text. If you select a specific condition, specify whether you want it to replace any condition applied to the found text or be added to it.

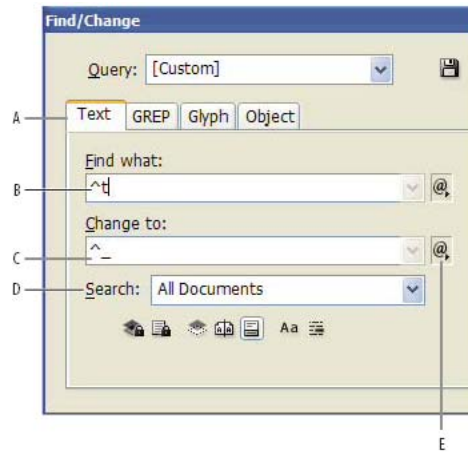

- 6 Click Find, and then use the Change, Change/Find, or Change All buttons to replace the condition.

Find/Change

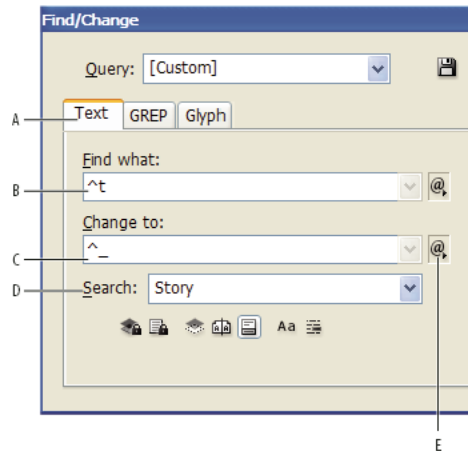

Find/Change overview

The Find/Change dialog box contains tabs that let you specify what you want to find and change.

Text

A Find/Change tabs B Find a tab character C Replace with an em dash D Search options E Metacharacters menu

A Find/Change tabs B Find a tab character C Replace with an em dash D Search options E Metacharacters menu

Text Search for and change specific occurrences of characters, words, groups of words, or text formatted a certain way. You can also search for and replace special characters such as symbols, markers, and white space characters. Wildcard options help to broaden your search.

GREP Use advanced, pattern-based search techniques to search for and replace text and formatting.

Glyph Search for and replace glyphs using Unicode or GID/CID values, especially useful to search for and replace glyphs in Asian languages.

Object Search for and replace formatting effects and attributes in objects and frames. For example, you can find objects with a 4-pt stroke and replace the stroke with a drop shadow.

Transliterate You can also convert the character type of Asian-language text. For example, you can search for half-width katakana and replace it with full-width katakana in Japanese text.

Find and change text

If you want to list, find, and replace fonts in your document, you might want to use the Find Font command instead of the Find/Change command.

Find and change text

- 1 To search a range of text or a story, select the text or place the insertion point in the story. To search more than one document, open the documents.
- 2 Choose Edit > Find/Change, and then click the Text tab.
- 3 Specify the range of your search from the Search menu, and click icons to include locked layers, master pages, footnotes, and other items in the search.
- 4 In the Find What box, describe what you want to search for:
 - Type or paste the text you want to find.
 - To search for or replace tabs, spaces, or other special characters, select a representative character (metacharacter) from the pop-up menu to the right of the Find What box. You can also choose wildcard options such as Any Digit or Any Character.

- Use a predefined query to find and replace text.
- 5 In the Change To box, type or paste the replacement text. You can also select a representative character from the pop-up menu to the right of the Change To box.
 - 6 Click Find.
 - 7 To continue searching, click Find Next, Change (to change the current occurrence), Change All (a message indicates the total number of changes), or Change/Find (to change the current occurrence and search for the next one).
 - 8 Click Done.

If you don't get the search results you expected, make sure that you clear any formatting you may have included in a previous search. You may also need to expand your search. For example, you may be searching only a selection or a story instead of the document. Or, you may be searching for text that appears on an item, such as a locked layer, footnote, or hidden conditional text, that is currently excluded from the search.

If you change your mind about replacing text, choose Edit > Undo Replace Text (or Undo Replace All Text).

To find the next occurrence of a previously searched-for phrase without having to open the Find/Change dialog box, choose Edit > Find Next. In addition, previous search strings are stored in the Find/Change dialog box. You can select a search string from the menu to the right of the option.

Find and change formatted text

- 1 Choose Edit > Find/Change.
- 2 If the Find Format and Change Format options don't appear, click More Options.
- 3 Click the Find Format box, or click the Specify Attributes To Find icon  to the right of the Find Format Settings section.
- 4 On the left side of the Find Format Settings dialog box, select a type of formatting, specify the format attributes, and then click OK.

Some OpenType formatting options appear in both the OpenType Options and Basic Character Formats (Position menu) sections. For information on OpenType and other formatting attributes, search for the related topic in InCopy Help.

Note: To search for (or replace with) formatting only, leave the Find What or Change To box blank.

- 5 If you want to apply formatting to the text found, click the Change Format box, or click the Specify Attributes To Change icon  in the Change Format Settings section. Then select a type of formatting, specify the format attributes, and click OK.
- 6 Use the Find and Change buttons to format the text.

If you specify formatting for your search criteria, info icons appear above the Find What or Change To boxes. These icons indicate that formatting attributes have been set and that the find or change operation will be restricted accordingly.

 To quickly remove all formatting attributes in the Find Format Settings or Change Format Settings sections, click the Clear button.

Common Find/Change techniques

Wildcard searches Specify wildcards, such as Any Digit or Any White Space, to broaden your search. For example, typing “s^?ng” in the Find What box searches for words beginning with an “s” and ending with “ng,” such as “sing,” “sang,” “song,” and “sung.” You can either type wildcard characters or choose an option from the Wildcards submenu in the pop-up menu next to the Find What text field.

Clipboard for metacharacter searches To search for metacharacters such as em dashes or bullet characters, you may want to select the text first and paste it into the Find What box to spare the trouble of entering metacharacters. InCopy automatically converts pasted special characters to their metacharacter equivalent.

Replace with clipboard contents You can replace search items with either formatted or unformatted content copied to the clipboard. You can even replace text with a graphic you copied. Simply copy the item, and then, in the Find/Change dialog box, choose an option from the Other submenu from the pop-up menu to the right of the Change To box.

Find and remove unwanted text To remove unwanted text, define the text you want to remove in the Find What box and leave the Change To box empty (make sure that no formatting is set in this box).

XML tagging You can apply XML tags to text you search for.

Notes on finding and changing text in InCopy

- If the Track Changes command is turned on when you are changing or replacing text, all added and deleted text is tracked.
- All finding and changing procedures work essentially the same way in Galley, Story, and Layout views, whether you work with a linked or stand-alone story. If you work with a linked story, you're limited to character and paragraph styles defined in InDesign. When you work in Galley or Story view, you cannot see all of the typographical effects you apply. You can see these effects only in Layout view.

Text

- In Galley view or Story view, the Find/Change command omits all collapsed stories. However, if you choose Change All, collapsed stories are affected. For best results, use Find/Change in Layout View.
- The Include Note Content in Find/Change Operations in Notes preferences determines whether notes are searched. If this option is selected, you can use the Find/Change command to search notes in Galley and Story views, not in Layout view. Closed notes and footnotes are omitted from the search.

Search options for finding and changing text

Search menu Contains options that determine the range of the search.

Documents

Search the entire document or All Documents to search all open documents.

Story

Search all text in the currently selected frame, including text in other threaded text frames and overset text. Select Stories to search stories in all selected frames. This option appears only if a text frame is selected or an insertion point is placed.

To End Of Story

Search from the insertion point. This option appears only if an insertion point is placed.

Selection

Search only selected text. This option appears only if text is selected.

Include Locked Layers

Searches for text on layers that have been locked using the Layer Options dialog box. You cannot replace text on locked layers.

Include Locked Stories

Searches for text in stories that have been checked out as part of an InCopy workflow. You cannot replace text in locked stories.

Include Hidden Layers

Searches for text on layers that have been hidden using the Layer Options dialog box. When text on a hidden layer is found, you can see highlighting where the text appears, but you cannot see the text. You can replace text on hidden layers.

Text in a hidden condition is always omitted from searching.

Include Master Pages

Searches for text on master pages.

Include Footnotes

Searches footnote text.

Case Sensitive

Searches for only the word or words that exactly match the capitalization of the text in the Find What box. For example, a search for *PrePress* won't find *Prepress*, *prepress*, or *PREPRESS*.

Text**Whole Word** 

(Roman text only) Disregards search characters if they are part of a Roman word. For example, if you are searching for *any* as a whole word, InDesign disregards *many*.

Whole Word 

Disregards search characters if they are part of another word. For example, if you search for *any* as a whole word, InDesign disregards *many*.

Kana Sensitive 

Distinguishes between hiragana and katakana. For example, if you search for Tango in hiragana, InDesign disregards Tango in katakana.

Full-Width/Half-Width Sensitive 

Distinguishes between half-width and full-width characters. For example, if you search for ka in half-width katakana, InDesign disregards ka in full-width katakana.

Search using GREP expressions

On the GREP tab of the Find/Change dialog box, you can construct GREP expressions to find alphanumeric strings and patterns in long documents or many open documents. You can enter the GREP metacharacters manually or choose them from the Special Characters For Search list. GREP searches are case-sensitive by default.

- 1 Choose Edit > Find/Change, and click the GREP tab.
- 2 At the bottom of the dialog box, specify the range of your search from the Search menu, and click icons to include locked layers, master pages, footnotes, and other items in the search.
- 3 In the Find What box, do any of the following to construct a GREP expression:
 - Enter the search expression manually.
 - Click the Special Characters For Search icon to the right of the Find What option and choose options from the Locations, Repeat, Match, Modifiers, and Posix submenus to help construct the search expression.
- 4 In the Change To box, type or paste the replacement text.
- 5 Click Find.
- 6 To continue searching, click Find Next, Change (to change the current occurrence), Change All (a message indicates the total number of changes), or Change/Find (to change the current occurrence and search for the next one).

 You can also use GREP Styles to apply a character style to text that conforms to a GREP expression. In fact, the GREP Styles dialog box is a good way to test your GREP expression. Add the examples you want to find to a paragraph, and then specify a character style and GREP expression in the GREP Styles dialog box. When you turn on Preview, you can edit the expression until it affects all your examples properly.

Tips for constructing GREP searches

Here are some tips for constructing GREP expressions.

- Many searches under the GREP tab are similar to those under the Text tab, but be aware that you need to insert different codes depending on which tab you're using. In general, the Text tab metacharacters begin with a ^ (such as ^t for a tab) and GREP tab metacharacters begin with a \ (such as \t for a tab). However, not all metacharacters follow this rule. For example, a paragraph return is ^p in the Text tab and \r in the GREP tab.

Text

- To search for a character that has symbolic meaning in GREP, enter a backslash (\) before the character to indicate that the character that follows is literal. For example, a period (.) searches for any character in a GREP search; to search for an actual period, enter “\.”
- Save the GREP search as a query if you intend to run it often or share it with someone else.
- Use parentheses to divide your search into subexpressions. For example, if you want to search for “cat” or “cot,” you can use the c(a|o)t string. Parentheses are especially useful to identify groupings. For example, searching for “the (cat) and the (dog)” identifies “cat” as Found Text 1 and “dog” as Found Text 2. You can use the Found Text expressions (such as \$1 for Found Text 1) to change only part of the found text.

GREP search examples

Follow these examples to learn how to take advantage of GREP expressions.

Example 1: Finding text within quotation marks

Suppose you want to search for any word enclosed in quotation marks (such as “Spain”), and you want to remove the quotation marks and apply a style to the word (so that it becomes *Spain* instead of “Spain”). The expression (“)(w+)(”) includes three groupings, as indicated by parentheses (). The first and third groupings search for any quotation mark, and the second grouping searches for one or more word characters.

You can use the Found Text expressions to refer to these groupings. For example, \$0 refers to all found text, and \$2 refers to only the second grouping. By inserting \$2 in the Change To field and specifying a character style in the Change Format field, you can search for a word within quotation marks, and then replace the word with a character style. Because only \$2 is specified, the \$1 and \$3 groupings are removed. (Specifying \$0 or \$1\$2\$3 in the Change To field would apply the character style to the quotation marks as well.)

A Finds all word characters enclosed in quotation marks **B** The character style is applied to the second grouping (the word) while the first and third groupings (open and close quotes) are removed **C** Character style specified

This example searches only for single words enclosed in quotation marks. If you want to search for phrases enclosed in parentheses, add wildcard expressions, such as (\s*.*\w*\d*), which looks for spaces, characters, word characters, and digits.

Text

Example 2: Phone numbers

InDesign includes a number of search presets that you can choose from the Queries menu. For example, you can choose the Phone Number Conversion query, which looks like this:

```
\(?:\d\d\d)\)?[-. ]?\d\d\d[-. ]?\d\d\d\d
```

Phone numbers in the United States can appear in a variety of formats, such as 206-555-3982, (206) 555-3982, 206.555.3982, and 206 555 3982. This string looks for any of these variations. The first three digits (\d\d\d) of the phone number may or may not be enclosed in parentheses, so a question mark appears after the parentheses: \(?: and \)??. Note that the backslash \ indicates that the actual parenthesis is being searched for and that it's not part of a subexpression. The brackets [] locate any character within them, so in this case, [-.] finds either a hyphen, a period, or a space. The question mark after the brackets indicate that the items within it are optional in the search. Finally, the digits are enclosed in parentheses, which signify groupings that can be referred to in the Change To field.

You can edit the grouping references in the Change To field to suit your needs. For example, you could use these expressions:

206.555.3982 = \$1.\$2.\$3

206-555-3982 = \$1-\$2-\$3

(206) 555-3982 = (\$1) \$2-\$3

206 555 3982 = \$1 \$2 \$3

Additional GREP examples

Experiment with the examples in this table to learn more about GREP searches.

Expression	Search string	Sample text	Matches (in bold)
Class of characters []	[abc] Finds the letter a, b, or c.	Maria cuenta bien.	Mariacuentabien.
Beginning of paragraph ^	^~_+. This searches the beginning of the paragraph (^) for an em dash (~_) followed by any character (.) one or more times (+).	"We saw—or at least we think we saw—a purple cow." —Konrad Yoes	"We saw—or at least we think we saw—a purple cow." —Konrad Yoes
Negative lookahead (?! <i>pattern</i>)	InDesign (?!CC.*?) The negative lookahead matches the search string only if it is not followed by the specified pattern.	InDesign, InDesign 2.0, InDesign CC, and InDesign CS2	InDesign, InDesign 2.0, InDesign CC, and InDesign CS2
Positive lookahead (?= <i>pattern</i>)	InDesign (?=CC.*?) The positive lookahead matches the search string only if it is followed by the specified pattern. Use similar patterns for negative lookbehinds (?<! <i>pattern</i>) and positive lookbehinds (?<= <i>pattern</i>).	InDesign, InDesign 2.0, InDesign CC, and InDesign CS2	InDesign, InDesign 2.0, InDesign CC, and InDesign CS2

Text

Expression	Search string	Sample text	Matches (in bold)
Groupings ()	(quick) (brown) (fox)	The quick brown fox jumps up and down.	The quick brown fox jumps up and down. All found text = quick brown fox; Found Text 1 = quick; Found Text 2 = brown; Found Text 3 = fox
Non-marking parentheses (?:expression)	(quick) (\$:brown) (fox)	The quick brown fox jumps up and down.	The quick brown fox jumps up and down. All found text = quick brown fox; Found Text 1 = quick; Found Text 2 = fox
Case-insensitive on (?i)	(?i)apple You can also use (?i:apple)	Apple apple APPLE	AppleappleAPPLE
Case-insensitive off (?-i)	(?-i)apple	Apple apple APPLE	Apple apple APPLE
Multiline on (?m)	(?m)^\w+ In this example, the expression looks for one or more (+) word characters (\w) at the beginning of a line (^). The (?m) expression allows all lines within the found text to be treated as separate lines. (?m)^\w matches the beginning of each paragraph. (?-m)^\w matches only the beginning of the story.	One Two Three Four Five Six Seven Eight	One Two Three Four Five Six Seven Eight
Multiline off (?-m)	(?-m)^\w+	One Two Three Four Five Six Seven Eight	One Two Three Four Five Six Seven Eight

Text

Expression	Search string	Sample text	Matches (in bold)
Single-line on (?s)	(?s)c.a The searches for any character (.) between the letters c and a. The (?s) expression matches any character, even if it falls on the next line. (.) matches anything other than a paragraph return. (?s)(.) matches anything, including paragraph returns.	abc abc abc abc	abc abcabc abc
Single-line off	(?-s)c.a	abc abc abc abc	abc abc abc abc
Repeat number of times { }	b{3} matches exactly 3 times b{3,} matches at least 3 times b{3,}? matches at least 3 times (shortest match) b{2,3} matches at least 2 times and not more than 3 b{2,3}? matches at least 2 times and not more than 3 (shortest match)	abbc abbbc abbbbc abbbbbc	abbc abbbc abbbbc abbbbbc abbc abbbc abbbbc abbbbbc abbc abbbc abbbbc abbbbbc abbc abbbc abbbbc abbbbbc abbc abbbc abbbbc abbbbbc

Metacharacters for searching

Metacharacters represent a character or symbol in InDesign. Metacharacters in the Text section of the Find/Change dialog box begin with a caret (^); metacharacters in the GREP section begin with a tilde (~) or backslash (\). You can type metacharacters in the Text tab or GREP tab of the Find/Change dialog box.

Save time fixing punctuation errors by saving search strings as queries.

Character:	Text tab metacharacter:	GREP tab metacharacter:

* Any character of a certain glyph set, such as a, à, á, â, ã, ä, å, Ä, Å, Ă, Ȧ, Ȧ and Ȧ		[[[:a=]]]

* Can be entered in the Find What box only, not the Change To box.

^ Can be entered in the Change To box, not the Find What box.

Convert double-byte character type

Use the Find/Change dialog box to convert the character type of Asian-language text.

- 1 Choose Edit > Find/Change.
- 2 Click the Transliterate tab.
- 3 At the bottom of the dialog box, specify the range from the Search menu, and click icons to determine whether items such as locked layers, master pages, and footnotes are included in the search.
- 4 Specify the character type in Find What.
- 5 Specify the replacement character type in Change To. Depending on the character type specified in Find What, some options in Change To may be unavailable. For example, if you select full-width hiragana in the Find What field, you cannot select full-width roman symbols in the Change To field.
- 6 Click the Find Next button, and then click the Change button.

Find and change objects

You can use the Find/Change command to find and replace the attributes and effects applied to objects, graphics frames, and text frames. For example, to give drop shadows a uniform color, transparency, and offset distance, you can use the Find/Change command to search for and replace drop shadows throughout a document.

- 1 Choose Edit > Find/Change.

Text

- 2 Click the Object tab.
- 3 Click the Find Object Format box, or click the Specify Attributes To Find icon .
- 4 On the left side of the Find Object Format Options dialog box, select a type of formatting, specify the format attributes, and then click OK.

Make sure that the categories you want to search for are in the appropriate state. You can use one of three states for each Effects category: turned on, turned off, or ignored. For example, setting Drop Shadow to On includes drop shadow formatting in the search; setting Drop Shadow to Off searches for objects in which drop shadow formatting is turned off; setting Drop Shadow to Ignore leaves drop shadows out of the search.

- 5 If you want to apply formatting to the object found, click the Change Object Format box, or click the Specify Attributes To Change icon  in the Change Format Settings section. Then select a type of formatting, specify the format attributes, and click OK.
- 6 Click the Find and Change buttons to format the objects.

Find and change glyphs

The Glyph section of the Find/Change dialog box is especially useful for replacing glyphs that share the same unicode value with other similar glyphs, such as alternate glyphs.

- 1 Choose Edit > Find/Change.
- 2 At the bottom of the dialog box, specify a range from the Search menu, and click icons to determine whether items such as locked layers, master pages, and footnotes are included in the search.
- 3 Under Find Glyph, select the Font Family and Font Style in which the glyph is located.

The Font Family menu displays only those fonts that are applied to text in the current document. Fonts in unused styles do not appear.
- 4 Do one of the following to enter the glyph you want to find in the Glyph box:
 - Click the button beside the Glyph box, and then double-click a glyph on the panel. This panel works like the Glyphs panel.
 - Choose Unicode or GID/CID, and enter the code for the glyph.

 *You can use other methods to enter the glyph you want to find in the Glyph box. Select a glyph in the document window and choose Load Selected Glyph In Find from the context menu, or select a glyph in the Glyphs panel and choose Load Glyph In Find from the context menu.*
- 5 Under Change Glyph, enter the replacement glyph by using the same techniques you use to enter the glyph you're searching for.
- 6 Click Find.
- 7 To continue searching, click Find Next, Change (to change the most recently found glyph), Change All (a message indicates the total number of changes), or Change/Find (to change the current occurrence and search for the next one).
- 8 Click Done.

Find and change fonts

Use the Find Font command to search for and list the fonts used throughout your document. You can then replace any fonts (except those in imported graphics) with any other fonts available on your system. You can even replace a font that's part of a text style. Note the following:

- A font name is listed once for its use in the layout and listed each time in imported graphics. For example, if you use the same font three times in the layout and three times in imported graphics, it will be listed in the Find Font dialog box four times—once for all layout instances, and three more times for each imported graphic. If fonts are not completely embedded in graphics, the font name may not be listed in the Find Font dialog box.
- Find Font is not available in a Story Editor window.
- The Find Font dialog box displays icons to indicate the kinds of fonts or font conditions, such as Type 1 fonts , imported images , TrueType fonts , OpenType fonts , and missing fonts .
- You can find and change composite fonts, but you cannot change component fonts that are part of composite fonts.
- Use the Type > Find Font command to help ensure consistent output by analyzing font usage on pages and in imported graphics. To find and change specific text attributes, characters, or styles, use the Edit > Find/Change command instead.

1 Choose Type > Find Font.

2 Select one or more font names in the Fonts In Document list.

3 Do one of the following:

- To find the first occurrence in the layout of the font selected in the list, click Find First. The text using that font moves into view. The Find First button is unavailable if the selected font is used in an imported graphic or if you selected multiple fonts in the list.
- To select an imported graphic that uses a font marked in the list by an imported image icon , click Find Graphic. The graphic also moves into view. The Find Graphic button isn't available if the selected font is used only in the layout or if you selected multiple fonts in the Fonts In Document list.

4 To see details about a selected font, click More Info. To hide the details, click Less Info. The Info area is blank if you selected multiple fonts in the list.

A font may be listed as Unknown if the file of the selected graphic doesn't supply information about it. Fonts in bitmap graphics (such as TIFF images) won't appear in the list at all because they aren't true characters.

5 To replace a font, select the new font you want to use from the Replace With list, and do one of the following:

- To change just one occurrence of the selected font, click Change. This option is not available if multiple fonts are selected.
- To change the font in that occurrence, and then find the next instance, click Change/Find. This option is not available if multiple fonts are selected.
- To change all instances of the font selected in the list, click Change All. If you want any paragraph or character style that includes the font being searched for to be redefined, select Redefine Style When Changing All.
- To change all instances of the font selected in the list, click Change All. If you want any paragraph style, character style, or named grid that includes the font being searched for to be redefined, select Redefine Style And Named Grid When Changing All.

When there are no more occurrences of a font in your file, its name is removed from the Fonts In Document list.

Note: To change fonts in imported graphics, use the program that originally exported the graphic, and then replace the graphic or update the link using the Links panel.

6 If you clicked Change, click Find Next to locate the next instance of the font.

Text**7** Click Done.

You can open the Find Font dialog box while preflighting a document. In the Preflight dialog box, switch to the Fonts tab and click Find Font.

To view the system folder in which a font appears, select the font in the Find Font dialog box and choose Reveal In Explorer (Windows) or Reveal In Finder (macOS).

Find/change items using queries

You can find and change text, objects, and glyphs by using or constructing a query. A *query* is a defined find-and-change operation. InDesign offers several preset queries for changing punctuation formats and other useful actions, such as changing telephone number formats. By saving a query you constructed, you can run it again and share it with others.

Search using queries

- 1** Choose Edit > Find/Change.
- 2** Choose a query from the Query list.
The queries are grouped by type.
- 3** Specify a range to search on the Search menu.
The search range is not stored with the query.
- 4** Click Find.
- 5** To continue searching, click Find Next, Change (to change the most recently found text or punctuation mark), Change All (a message indicates the total number of changes), or Change/Find (to change text or punctuation marks and continue your search).

After you select a search query, you can adjust the settings to fine-tune your search.

Save queries

Save a query in the Find/Change dialog box if you want to run it again or share it with others. The names of queries you save appear in the Query list in the Find/Change dialog box.

- 1** Choose Edit > Find/Change.
- 2** Select Text, GREP, or a different tab to undertake the search you want.
- 3** Below the Search menu, click icons to determine whether items such as locked layers, master pages, and footnotes are included in the search.

These items are included in the saved query. However, the range of the search isn't saved with the query.

- 4** Define the Find What and Change To fields.
- 5** Click the Save Query button in the Find/Change dialog box and enter a name for the query.

If you use the name of an existing query, you are asked to replace it. Click Yes if you want to update the existing query.

Delete queries

Select it on the Query list and click the Delete Query button.

Load queries

Customized queries are stored as XML files. The names of customized queries appear in the Query list in the Find/Change dialog box.

To load a query that was given to you so that it appears in the Query list, copy the query file to the appropriate location:

macOS Users\[username]\Library\Preferences\Adobe InCopy \[Version]\[Language]\Find-Change Queries\[query type]

Windows Users\[username]\AppData\Roaming\Adobe\InCopy \[Version]\[Language]\Find-Change Queries\[query type]

Footnotes

Create footnotes

A footnote consists of two linked parts: the footnote reference number that appears in text, and the footnote text that appears at the bottom of the column. You can create footnotes or import them from Word or RTF documents.

Footnotes are automatically numbered as they are added to a document. Numbering restarts in each story. You can control the numbering style, appearance, and layout of footnotes. You cannot add footnotes to tables or to footnote text.

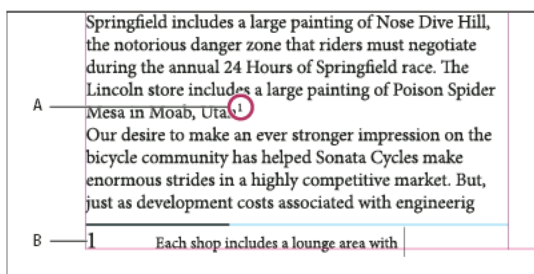

The width of the footnote text is based on the width of the column containing the footnote reference marker.

Footnotes cannot space columns in a text frame.

You can create endnotes in InDesign. Endnotes in converted Microsoft Word documents are formatted as text, not footnotes.

- 1 Place the insertion point where you want the footnote reference number to appear.
- 2 Choose Type > Insert Footnote.
- 3 Type the footnote text.

Text

A Reference number B Footnote text

As you type in Layout view, the footnote area expands while the text frame remains the same size. The footnote area continues to expand upward until it reaches the line with the footnote reference. At that point, the footnote is split to the next page, if possible. If the footnote cannot be split, and if more text is added than can fit in the footnote area, the line containing the footnote reference is moved to the next page, or an overset icon appears. In such a case, you should consider changing the text formatting.

 When the insertion point is in a footnote, you can choose **Type > Go To Footnote Reference** to return to where you were typing. If you use this option frequently, consider creating a keyboard shortcut.

Change footnote numbering and layout

Changes you make to footnote numbering and layout affect existing footnotes and all new ones.

Note: In *InCopy*, change footnote numbering and layout options only for standalone documents. The *InDesign* document's footnote settings will override any changes you make to a linked (managed) file in *InCopy*.

- 1 Choose **Type > Document Footnote Options**.
- 2 In the **Numbering And Formatting** tab, select options that determine the numbering scheme and formatting appearance of the reference number and footnote text.
- 3 Click the **Layout** tab, and select options that control the look of the footnote section on the page.
- 4 Click **OK**.

Footnote numbering and formatting options

The following options appear in the **Numbering And Formatting** section of the **Footnote Options** dialog box:

Numbering Style Choose the numbering style for footnote reference numbers.

Start At Specify the number used for the first footnote in the story. Each story in a document begins with the same **Start At** number. If you have multiple documents in a book with continued page numbering, you may want to start the footnote numbering in each chapter to continue where the last chapter left off.

The **Start At** option is especially useful for documents in a book. Footnote numbering is not continued across documents in a book.

Restart Numbering Every If you want numbering to restart within the document, select this option and choose **Page**, **Spread**, or **Section** to determine when footnote numbering is restarted. Some numbering styles, such as asterisks (*), work best when reset every page.

Show Prefix/Suffix In Select this option to show prefixes or suffixes in the footnote reference, the footnote text, or both. Prefixes appear before the number (such as [1]) and suffixes appear after the number (such as 1]). This option is especially useful for placing footnotes within characters, such as [1]. Type a character or characters or select an option

Text

for Prefix, Suffix, or both. To select special characters, click the icons next to the Prefix and Suffix controls to display a menu.

 *If you think the footnote reference number is too close to the preceding text, adding one of the space characters as a prefix might improve the appearance. You can also apply a character style to the reference number.*

Position This option determines the appearance of the footnote reference number, which is superscript by default. If you prefer to format the number using a character style (such as a character style that includes OpenType superscript settings), choose Apply Normal, and specify the character style.

This option determines the appearance of the footnote reference number, which is Ruby by default. Choosing Apply Normal is useful if you want to format the reference number's position using a character style.

Character Style You may want to choose a character style to format the footnote reference number. For example, instead of using superscript, you might want to use a character style at a normal position with an elevated baseline. The menu displays the character styles available in the Character Styles panel.

Paragraph Style You may want to choose a paragraph style that formats the footnote text for all footnotes in the document. The menu displays the paragraph styles available in the Paragraph Styles panel. By default, the [Basic Paragraph] style is used. Note that the [Basic Paragraph] style may not have the same appearance as the default font settings for the document.

Separator The separator determines the white space that appears between the footnote number and the start of the footnote text. To change the separator, first select or delete the existing separator, and then choose a new separator. You can include multiple characters. To insert white space characters, use the appropriate metacharacter, such as ^m for em space.

Footnote layout options

The following options appear in the Layout section of the Footnote Options dialog box:

Minimum Space Before First Footnote This option determines the minimum amount of space between the bottom of the column and the first footnote line. You cannot use a negative value. Any Space Before setting in the footnote paragraph is ignored.

Space Between Footnotes This option determines the distance between the last paragraph of one footnote and the first paragraph of the next footnote in a column. You cannot use a negative value. The Space Before/Space After values in a footnote's paragraph apply only if the footnote includes multiple paragraphs.

First Baseline Offset This option determines the distance between the start of the footnote area (where the footnote divider appears by default) and the first line of footnote text.

Place End Of Story Footnotes At Bottom Of Text Select this option if you want the last column's footnotes to appear just below the text in the last frame of the story. If this option is not selected, any footnote in the last frame of the story appears at the bottom of the column.

Allow Split Footnotes Select this option if you want footnotes to break across a column when the footnote exceeds the amount of space available for it in that column. If splitting is not allowed, the line containing the footnote reference number moves to the next column, or the text becomes overset.

 *If Allow Split Footnotes is turned on, you can still prevent an individual footnote from splitting by placing the insertion point in the footnote text, choosing Keep Options from the Paragraph panel menu, and selecting the Keep Lines Together and All Lines In Paragraph options. If the footnote contains multiple paragraphs, use the Keep With Next X Lines option in the first paragraph of the footnote text. You can choose Type > Insert Break Character > Column Break to control where the footnote is split.*

Text

<p>an artist to paint a mural on the wall of each store. Sonata Cycles in Springfield includes a large painting of Nose Dive Hill, the notorious danger zone that riders must negotiate during the annual 24 Hours of Springfield race. <p>¹ Each shop includes a lounge area with chairs and tables built out of spare bicycle parts. The coffee</p>	<p>table sports a</p>

Rule Above Specify the location and appearance of the footnote divider line that appears above the footnote text. A divider line (also called a “separator line”) also appears above any footnote text continued in a separate frame. The options you select apply to either the First Footnote In Column or Continued Footnotes, whichever is selected in the menu. These options are similar to those that appear when you specify a paragraph rule. If you want to remove the footnote divider line, deselect Rule On.

Delete footnotes

To delete a footnote, select the footnote reference number that appears in text, and then press Backspace or Delete. If you delete only the footnote text, the footnote reference number and footnote structure remain.

Work with footnote text

As you edit footnote text, note the following:

- When the insertion point is in footnote text, choosing Edit > Select All selects all the footnote text for that footnote, but no other footnote or text.
- Use the arrow keys to navigate among footnotes.
- Footnote numbering is not continued across documents in a book. If you don’t want numbering to restart in each document with the book, you need to change the Start At value manually in each document after the editing is final.
- In Story Editor, you can click the footnote icon to expand or collapse a footnote. You can expand or collapse all footnotes by choosing View > Story Editor > Expand All Footnotes or Collapse AllFootnotes.
- In Galley view or Story view, you can click the footnote icon to expand or collapse footnotes. You can expand or collapse all footnotes by right-clicking (Windows) or Ctrl-clicking (macOS) a footnote and choosing Expand All Footnotes or Collapse All Footnotes.
- You can select and apply character and paragraph formatting to footnote text. You can also select and change the appearance of the footnote reference number, but the recommended method is using the Document Footnote Options dialog box.
- When you cut or copy text that includes the footnote reference number, the footnote text is also added to the clipboard. If you copy the text to a different document, the footnotes in that text use the characteristics of the new document’s numbering and layout appearance.
- If you accidentally delete the footnote number at the start of the footnote text, you can add it back by placing the insertion point at the beginning of the footnote text, right-clicking (Windows) or Control-clicking (macOS), and choosing Insert Special Character > Markers > Footnote Number.
- Text wrap has no effect on footnote text.
- If you clear overrides and character styles on a paragraph that includes a footnote reference marker, the footnote reference numbers lose the attributes you applied in the Document Footnote Options dialog box.

Chapter 6: Styles

Paragraph and character styles

About character and paragraph styles

A *character style* is a collection of character formatting attributes that can be applied to text in a single step. A *paragraph style* includes both character and paragraph formatting attributes, and can be applied to a paragraph or range of paragraphs. Paragraph styles and character styles are found on separate panels. Paragraph and character styles are sometimes called *text styles*.

A *named grid* format can be applied to a frame grid in the Frame Grid format settings. You can also use create an object style with grid characteristics.

When you change the formatting of a style, all text to which the style has been applied will be updated with the new format.

You can create, edit, and delete styles in stand-alone Adobe InCopy documents or in InCopy content that is linked to an Adobe InDesign document. When the contents are updated in InDesign, new styles are added to the InDesign document, but any style modifications made in InCopy will be overridden by the InDesign style. For linked content, it is usually best to manage your styles in InDesign.

[Basic Paragraph] styles

By default, each new document contains a [Basic Paragraph] style that is applied to text you type. You can edit this style, but you can't rename or delete it. You can rename and delete styles that you create. You can also select a different default style to apply to text.

Character style attributes

Unlike paragraph styles, character styles do not include all the formatting attributes of selected text. Instead, when you create a character style, InDesign makes only those attributes that are different from the formatting of the selected text part of the style. That way, you can create a character style that, when applied to text, changes only some attributes, such as the font family and size, ignoring all other character attributes. If you want other attributes to be part of the style, add them when editing the style.

Next Style

You can automatically apply styles as you type text. If, for example, your document's design calls for the style "body text" to follow a heading style named "heading 1," you can set the Next Style option for "heading 1" to "body text." After you've typed a paragraph styled with "heading 1," pressing Enter or Return starts a new paragraph styled with "body text."

Styles

If you use the context menu when applying a style to two or more paragraphs, you can cause the parent style to be applied to the first paragraph and the Next Style to be applied to the additional paragraphs.

To use the Next Style feature, choose a style from the Next Style menu when you're creating or editing a style.

Styles panel overview

Use the Character Styles panel to create, name, and apply character styles to text within a paragraph; use the Paragraph Styles panel to create, name, and apply paragraph styles to entire paragraphs. Styles are saved with a document and display in the panel each time you open that document.

When you select text or position the insertion point, any style that has been applied to that text is highlighted in either of the Styles panels, unless the style is in a collapsed style group. If you select a range of text that contains multiple styles, no style is highlighted in the Styles panel. If you select a range of text to which multiple styles are applied, the Styles panel displays "(Mixed)."

Open the Paragraph Styles panel

Choose Type > Paragraph Styles, or click the Paragraph Styles tab, which appears by default on the right side of the application window.

Open the Character Styles panel

Choose Type > Character Styles, or click the Character Styles tab on the right side of the application window.

Add paragraph and character styles

If the styles you want already exist in another InDesign, InCopy, or word-processing document, you can import those styles for use in your current document. If you are working with a stand-alone story, you can also define character and paragraph styles in InCopy.

Define paragraph or character styles

- 1 If you want to base a new style on the formatting of existing text, select that text or place the insertion point in it.
If a group is selected in the Styles panel, the new style will be part of that group.

- 2 Choose New Paragraph Style from the Paragraph Styles panel menu, or choose New Character Style from the Character Styles panel menu.

- 3 For Style Name, type a name for your new style.

- 4 For Based On, select which style the current style is based on.

Note: The Based On option lets you link styles to each other, so that changes in one style ripple through the styles that are based on it. By default, new styles are based on [No Paragraph Style] for paragraph styles or [None] for character styles, or on the style of any currently selected text.

- 5 For Next Style (Paragraph Styles panel only), specify which style is applied after the current style when you press Enter or Return.

- 6 To add a keyboard shortcut, position the insertion point in the Shortcut box, and make sure Num Lock is turned on. Then hold down any combination of Shift, Alt, and Ctrl (Windows), or Shift, Option, and Command (macOS), and press a number on the numeric keypad. You cannot use letters or non-keypad numbers for defining style shortcuts. If your keyboard does not have a Num Lock key, you cannot add keyboard shortcuts to styles.

Styles

- 7 If you want the new style to be applied to the selected text, select Apply Style To Selection.
- 8 To specify the formatting attributes, click a category (such as Basic Character Formats) on the left, and specify the attributes you want to add to your style.

 When specifying a Character Color in the Style Options dialog box, you can create a new color by double-clicking the fill or stroke box.

- 9 For character styles, attributes you do not specify are ignored; when the style is applied, text will retain the paragraph style formatting for that attribute. To remove an attribute setting from a character style:
 - From a setting's menu, choose (Ignore).
 - In a text box, delete the option text.
 - In a check box, click until you see a small box (Windows) or a hyphen (-) (macOS).
 - For a character color, hold down Ctrl (Windows) or Command (macOS) and click the color swatch.
- 10 When you've finished specifying the formatting attributes, click OK.

Styles you create appear only in the current document. If no document is open, the styles you create will appear in all new documents.

Base one paragraph or character style on another

Many document designs feature hierarchies of styles sharing certain attributes. The headings and subheads, for example, often use the same font. You can easily create links between similar styles by creating a base, or *parent*, style. When you edit the parent style, the *child* styles will change as well. You can then edit the child styles to distinguish them from the parent style.

 To create a style that's nearly identical to another style, but without the parent-child relationship, use the Duplicate Style command and then edit the copy.

- 1 Create a new style.
- 2 In the New Paragraph Style or New Character Style dialog box, select the parent style in the Based On menu. The new style becomes the child style.

By default, new styles are based on [No Paragraph Style] or [None], or on the style of any currently selected text.
- 3 Specify formatting in the new style to distinguish it from the style on which it's based. For example, you might want to make the font used in a subheading slightly smaller than the one used in the heading (parent) style.

 If you make changes to the formatting of a child style and decide you want to start over, click Reset To Base. That restores the child style's formatting to be identical to the style on which it's based. Then you can specify new formatting. Similarly, if you change the Based On style of the child style, the child style definition is updated to match its new parent style.

Import styles from other documents

You can import paragraph and character styles from another InDesign document (any version) into the active document. During import, you can determine which styles are loaded and what should occur if a loaded style has the same name as a style in the current document. You can also import styles from an InCopy document.

You can import paragraph styles and character styles from an InDesign or InCopy document into a stand-alone InCopy document or InCopy content that is linked to InDesign. You can determine which styles are loaded, and what should occur if a loaded style has the same name as a style in the current document.

Styles

Note: If you import styles into linked content, new styles are added to the InDesign document when the content is updated, and any style with a name conflict is overridden by the InDesign style with the same name.

- 1 In the Character Styles or Paragraph Styles panel, do one of the following:
 - Choose Load Character Styles or Load Paragraph Styles in the Styles panel menu.
 - Choose Load All Text Styles in the Styles panel menu to load both character and paragraph styles.
- 2 Double-click the InDesign document containing the styles you want to import.
- 3 In the Load Styles dialog box, make sure that a check mark appears next to the styles you want to import. If any existing style has the same name as one of the imported styles, choose one of the following options under Conflict With Existing Style, and then click OK:

Use Incoming Style Definition Overwrites the existing style with the loaded style and applies its new attributes to all text in the current document that used the old style. The definitions of the incoming and existing styles are displayed at the bottom of the Load Styles dialog box so that you can view a comparison.

Auto-Rename Renames the loaded style. For example, if both documents have a Subheading style, the loaded style is renamed “Subheading copy” in the current document.

You can also use the Books feature to share styles.

Map styles to export tags | CC

Introduction to export tags

Use Export Tagging to define how text with InDesign styles is marked up in HTML, EPUB, or tagged PDF output.

You can also specify CSS class names to add to the exported content. In EPUB/HTML export, CSS classes can be used to differentiate between slight variations in styling. It is not required that you enter a class name - InDesign automatically generates one based on the Style Name.

You cannot preview Export Tagging within the InDesign layout, as it only impacts the exported EPUB, HTML, or PDF file.

Edit All Export Tags lets you efficiently view and modify the mappings in a single dialog box.

Define style-tag mapping

- 1 For the style to map, open the paragraph, character, or Object Style Options dialog box.
- 2 Click Export Tagging in the left pane, and do one of the following:
 - Choose a Tag to map for EPUB and HTML output.
 - Specify a Class to map for EPUB and HTML output. Class names are used to generate style definitions for default tags.
 - If you want to include this style in the CSS, select the Emit CSS checkbox. If you don't select the checkbox, no CSS class will be generated for this style. If you have two or more styles having the same class assigned, InDesign displays an error/warning message while exporting. This option is available only in InDesign CC.
 - Choose a Tag to map for PDF output. This option is available only for paragraph styles.

Edit all export tags

You can view and modify all export tags together in a single window.

- 1 Select Edit All Export Tags in the Paragraph, Character, or Object style panel menu.
- 2 Click EPUB and HTML, or PDF.
- 3 Click the tag corresponding to the style. It gets converted to a list; choose the new value.

Convert Word styles to InDesign styles

While importing a Microsoft Word document into InDesign or InCopy, you can map each style used in Word to a corresponding style in InDesign or InCopy. By doing so, you specify which styles format the imported text. A disk icon  appears next to each imported Word style until you edit the style in InDesign or InCopy.

- 1 Do one of the following:
 - To add the Word document to existing text in InDesign or InCopy, choose File > Place. Select Show Import Options, and then double-click the Word document.
 - To open the Word document in a stand-alone InCopy document, start InCopy, choose File > Open, and then double-click the Word file.
- 2 Select Preserve Styles And Formatting From Text And Tables.
- 3 Select Customized Style Import, and then click Style Mapping.
- 4 In the Style Mapping dialog box, select the Word style, and then select an option from the menu under InCopy style. You can choose the following options:
 - If there is no style name conflict, choose New Paragraph Style, New Character Style, or choose an existing InCopy style.
 - If there is a style name conflict, choose Redefine InCopy Style to format the imported style text with the Word style. Choose an existing InCopy style to format the imported style text with the InCopy style. Choose Auto Rename to rename the Word style.
- 5 Click OK to close the Style Mapping dialog box, and then click OK to import the document.

Apply styles

By default, applying a paragraph style won't remove any existing character formatting or character styles applied to part of a paragraph, although you have the option of removing existing formatting when you apply a style. A plus sign (+) appears next to the current paragraph style in the Styles panel if the selected text uses a character or paragraph style and also uses additional formatting that isn't part of the applied style. Such additional formatting is called an *override* or *local* formatting.

Character styles remove or reset character attributes of existing text if those attributes are defined by the style.

Apply a character style

- 1 Select the characters to which you want to apply the style.
- 2 Do one of the following:
 - Click the character style name in the Character Styles panel.
 - Select the character style name from the drop-down list in the Control panel.
 - Press the keyboard shortcut you assigned to the style. (Make sure that Num Lock is on.)

Apply a paragraph style

- 1 Click in a paragraph, or select all or part of the paragraphs to which you want to apply the style.
- 2 Do one of the following:
 - Click the paragraph style name in the Paragraph Styles panel.
 - Select the paragraph style name from the menu in the Control panel.
 - Press the keyboard shortcut you assigned to the style. (Make sure that Num Lock is on.)
- 3 If any unwanted formatting remains in the text, choose Clear Overrides from the Paragraph Styles panel.

Apply sequential styles to multiple paragraphs

The Next Style option specifies which style will be automatically applied when you press Enter or Return after applying a particular style. It also lets you apply different styles to multiple paragraphs in a single action.

For example, suppose you have three styles for formatting a newspaper column: Title, Byline, and Body. Title uses Byline for Next Style, Byline uses Body for Next Style, and Body uses [Same Style] for Next Style. If you select an entire article, including the title, the author's byline, and the paragraphs in the article, and then apply the Title style using the special "Next Style" command in the context menu, the article's first paragraph will be formatted with the Title style, the second paragraph will be formatted with the Byline style, and all other paragraphs will be formatted with the Body style.

that made it seem interminable. Anyway, we got home and life retu

- 1 Select the paragraphs to which you want to apply the styles.
- 2 In the Paragraph Styles panel, right-click (Windows) or Control-click (macOS) the parent style, and then choose Apply [Style Name] Then Next Style.

If the text includes formatting overrides or character styles, the context menu also lets you remove overrides, character styles, or both.

Edit character and paragraph styles

One of the advantages of using styles is that when you change the definition of a style, all of the text formatted with that style changes to match the new style definition.

Note: If you edit styles in InCopy content that's linked to an InDesign document, the modifications are overridden when the linked content is updated.

Edit a style using the dialog box

- 1 Do one of the following:
 - If you don't want the style to be applied to selected text, right-click (Windows) or Control-click (macOS) the style name in the Styles panel, and choose Edit *[style name]*.
 - In the Styles panel, double-click the style name, or select the style and choose Style Options in the Styles panel menu. Note that this applies the style to any selected text or text frame or, if no text or text frame is selected, sets the style as the default style for any text you type in new frames.
- 2 Adjust settings in the dialog box, and then click OK.

Redefine a style to match selected text

After you apply a style, you can override any of its settings. If you decide you like the changes you made, you can redefine the style so that it matches the formatting of the text you changed.

Note: If you redefine styles in InCopy content linked to an InDesign document, the modifications are overridden when the linked content is updated.

- 1 Using the Type tool , select the text formatted with the style you want to redefine.
- 2 Make changes to the paragraph or character attributes as necessary.
- 3 Choose Redefine Style in the Styles panel menu.

Delete character or paragraph styles

When you delete a style, you can select a different style to replace it, and you can choose whether to preserve the formatting. When you delete a style group, you delete all styles within the group. You are prompted to replace each style in the group one at a time.

- 1 Select the style name in the Styles panel.
- 2 Do one of the following:
 - Choose Delete Style in the panel menu or click the Delete icon  at the bottom of the panel.
 - Right-click (Windows) or Control-click (macOS) the style, and then choose Delete Style. This method is especially useful for deleting a style without applying it to text.
- 3 In the Delete Paragraph Style dialog box, select the style to replace it.

If you select [No Paragraph Style] to replace a paragraph style or [None] to replace a character style, select Preserve Formatting to keep the formatting of text to which the style is applied. The text preserves its formatting but is no longer associated with a style.

- 4 Click OK.

 To delete all unused styles, choose Select All Unused in the Styles panel menu, and then click the Delete icon. When you delete an unused style, you are not prompted to replace the style.

Override character and paragraph styles

When you apply a paragraph style, character styles and other previous formatting remain intact. After you apply a style, you can override any of its settings by applying formatting that's not part of the style. When formatting that is not part of a style is applied to text with that style applied, it is called an *override* or *local* formatting. When you select text with an override, a plus sign (+) appears next to the style name. In character styles, an override is displayed only if the applied attribute is part of the style. For example, if a character style only changes text color, applying a different font size to the text does not appear as an override.

Styles

You can clear character styles and formatting overrides when you apply a style. You can also clear overrides from a paragraph to which a style has been applied.

 If a style has a plus sign (+) next to it, hold the mouse pointer over the style to view a description of the override attributes.

Preserve or remove overrides when applying paragraph styles

- To apply a paragraph style and preserve character styles, but remove overrides, hold down Alt (Windows) or Option (macOS) as you click the name of the style in the Paragraph Styles panel.
- To apply a paragraph style and remove both character styles and overrides, hold down Alt+Shift (Windows) or Option+Shift (macOS) as you click the name of the style in the Paragraph Styles panel.

 Right-click (Windows) or Control-click (macOS) the style in the Paragraph Styles panel, and then choose an option from the context menu. You can then clear overrides, character styles, or both while applying the style.

Highlight character and paragraph style overrides

To identify all the Paragraph and Character style overrides applied in your document do the following:

- 1 Open the paragraph or character styles panel.
- 2 Do one of the following:
 - Click the Style Override Highlighter icon .
 - Choose Toggle Style Override Highlighter from the panel menu.

The Style Override Highlighter highlights all the paragraph and character style overrides in your document.

Note: You can associate a keyboard shortcut with Toggle Style Override Highlighter option to access it easily.

Clear paragraph style overrides

- 1 Select the text containing the overrides. You can even select multiple paragraphs with different styles.
- 2 In the Paragraph Styles panel, do any of the following:
 - To remove paragraph and character formatting, click the Clear Overrides icon , or choose Clear Overrides from the Paragraph Styles panel.
 - To remove character overrides, but preserve paragraph formatting overrides, hold down Ctrl (Windows) or Command (macOS) as you click the Clear Overrides icon.
 - To remove paragraph-level overrides, but preserve character-level overrides, in the Paragraph Styles panel, hold down Shift+Ctrl (Windows) or Shift+Command (macOS) as you click the Clear Overrides icon.

Note: When you clear overrides, paragraph-level overrides are removed from the entire paragraph, even if only part of the paragraph is selected. Character-level overrides are removed only from the selection.

Clearing overrides does not remove character style formatting. To remove character style formatting, select the text containing the character style, and then click [None] in the Character Styles panel.

Break the link between text and its style

When you break the link between text and its style, the text retains its current formatting. However, future changes to that style will not be reflected in the text that was separated from the style.

- 1 Select the text that is marked with the style that you want to break from.
- 2 Choose Break Link To Style from the Styles panel menu.

If no text is selected when you choose Break Link To Style, any new text you type uses the same formatting as the selected style, but no style is assigned to that text.

Convert style bullets and numbering to text

When you create a style that adds bullets or numbering to paragraphs, these bullets and numbers may be lost if the text is copied or exported to a different application. To avoid this problem, convert the style bullets or numbering to text.

Note: If you convert style bullets in an InCopy story linked to an InDesign layout, the change may be overridden when the content is updated in InDesign.

- 1 In the Paragraph Styles panel, select the style that contains the bullets and numbering.
- 2 In the Paragraph Styles panel menu, choose Convert “[style]” Bullets and Numbering to Text.

If you convert bullets and numbering to text in a style on which another style is based (a *parent* style), the bullets and numbering in the child style are also converted to text.

After you convert numbering to text, you may need to update numbers manually if you edit the text.

Find and replace character and paragraph styles

Use the Find/Change dialog box to find instances of a particular style and replace it with another.

- 1 Choose Edit > Find/Change.
- 2 For Search, select Document to change the style throughout the document.
- 3 Leave the Find What and Change To options blank. If the Find Format and Change Format boxes don't appear at the bottom of the dialog box, click More Options.
- 4 Click the Find Format box to display the Find Format Settings dialog box. Under Style Options, select the character or paragraph style you want to search for, and then click OK.
- 5 Click the Change Format box to display the Change Format Settings dialog box. Under Style Options, select the replacement character or paragraph style, and then click OK.
- 6 Click Find, and then use the Change, Change/Find, or Change All buttons to replace the style.

Working with styles

Duplicate styles or style groups

Right-click (Windows) or Control-click (macOS) a style or style group in the Styles panel, and then choose Duplicate Style.

A new style or group appears in the Styles panel, with the same name followed by “copy.” If you duplicated a group of styles, the style names within the new group remain the same.

You can also duplicate styles by copying them to another group.

Group styles

You can organize styles by grouping them into separate folders in the Character Styles, Paragraph Styles, Object Styles, Table Styles, and Cell Styles panels. You can even nest groups within groups. Styles do not need to be in a group; you can add them to a group or to the root level of the panel.

Create a style group

- 1 In the Styles panel:
 - To create the group at the root level, deselect all styles.
 - To create a group within a group, select and open a group.
 - To include existing styles in the group, select the styles.
- 2 Choose New Style Group from the Styles panel menu, or choose New Group From Styles to move the selected styles into the new group.
- 3 Type the name of the group and click OK.
- 4 To move a style into the group, drag the style over the style group. When the style group is highlighted, release the mouse button.

Copy styles to a group

When you copy a style to a different group, the styles are not linked. Even though they have the same name, editing one style does not change the attributes of the other style.

- 1 Select the style or group you want to copy.
- 2 Choose Copy To Group from the Styles panel menu.
- 3 Select the group (or [Root] level) that you want to copy the styles or group to, and then click OK.

If the group already contains style names identical to those being copied, incoming styles are renamed.

Expand or collapse style groups

- To expand or collapse only one group, click the triangle icon next to it.
- To expand or collapse the group and all its subgroups, Ctrl-click (Windows) or Command-click (macOS) the triangle icon.

Delete style groups

Deleting a style group deletes the group and everything inside it, including styles and other groups.

- 1 Select the group you want to delete.
- 2 Choose Delete Style Group from the Styles panel menu, and then click Yes.
- 3 For each style in the group, specify a replacement style or choose [None], and then click OK.

 *If you want to use the same replacement style for all styles, select Apply To All.*

If you cancel the replacement of any style, the group is not deleted. You can recover deleted styles by choosing Edit > Undo Delete Styles.

Move and reorder styles

By default, styles you create appear at the bottom of the style group or panel.

- To alphabetize all groups and styles within groups, choose Sort By Name from the Styles panel menu.
- To move a single style, drag it to a new location. A black line indicates where the style will be moved to; a highlighted group folder indicates that the style will be added to that group.

Drop caps and nested styles

There are three main ways to use Drop Caps and Nested Styles feature: to apply a character style to a drop cap, to apply a nested style to text at the beginning of a paragraph, and to apply a nested line style to one or more lines in a paragraph.

Apply a character style to a drop cap

You can apply a character style to the drop-cap character or characters in a paragraph. For example, if you want a drop-cap character to have a different color and font than the rest of the paragraph, you can define a character style that has these attributes. Then you can either apply the character style directly to a paragraph, or you can nest the character style in a paragraph style.

Note: *You cannot create new styles in InCopy content linked to an InDesign layout.*

- 1 Create a character style that has the formatting you want to use for the drop-cap character.

Styles

2 Do one of the following:

- To apply the drop cap to a single paragraph, choose Drop Caps And Nested Styles from the Paragraph panel menu.
- To nest the character style in a paragraph style, double-click the paragraph style, and then click Drop Caps And Nested Styles.

3 Specify the number of drop-cap lines and characters, and then choose the character style.

4 If the drop cap is aligned too far away from the left edge, select Align Left Edge.

Selecting this option uses the original left side bearing of the drop-cap character rather than the larger value. It's particularly useful for drop caps formatted in sans serif fonts.

5 If the drop cap character overlaps the text below it, select Scale For Descenders.

6 To control how text that wraps around the drop cap is adjusted relative to the frame grid, choose an option from the menu.

Ignore Frame Grid The drop cap and text are not adjusted, so text may not align to the frame's grid.

Pad To Frame Grid The drop cap is not scaled and the text is aligned to the grid, so there may be extra white space between the drop cap and text that wraps around it.

Scale Up To Grid This option scales the drop cap to be wider for horizontal text or taller for vertical text so that the text aligns with the grid.

Scale Down To Grid This option scales the drop cap to be narrower for horizontal text for shorter for vertical text so that the text aligns with the grid.

7 Click OK.

If you want to apply a different nested style to any characters after the drop cap, use the New Nested Style option.

Create nested styles

You can specify character-level formatting for one or more ranges of text within a paragraph or line. You can also set up two or more nested styles to work together, one taking over where the previous one ends. For paragraphs with repetitive and predictable formatting, you can even loop back to the first style in the sequence.

Nested styles are especially useful for run-in headings. For example, you can apply one character style to the first letter in a paragraph and another character style that takes effect through the first colon (:). For each nested style, you can define a character that ends the style, such as a tab character or the end of a word.

Note: You can create new styles in a stand-alone InCopy document, but not in content linked to an InDesign layout.

Create one or more nested styles

- 1 Create one or more character styles that you want to use to format text.
- 2 Do one of the following:
 - To add nested styles to a paragraph style, double-click the paragraph style, and then click Drop Caps And Nested Styles.
 - To add nested styles to a single paragraph, choose Drop Caps And Nested Styles from the Paragraph panel menu.

Note: For best results, apply nested styles as part of paragraph styles. If you apply nested styles as local overrides to a paragraph, subsequent editing or formatting changes in the nested style can produce unexpected character formatting in the styled text.

- 3 Click New Nested Style one or more times.

Styles

4 Do any of the following for each style, and then click OK:

- Click the character style area, and then select a character style to determine the appearance of that section of the paragraph. If you haven't created a character style, choose New Character Style and specify the formatting you want to use.
- Specify the item that ends the character style formatting. You can also type the character, such as a colon (:) or a specific letter or number. You cannot type a word.
- Specify how many instances of the selected item (such as characters, words, or sentences) are required.
- Choose Through or Up To. Choosing Through includes the character that ends the nested style, while choosing Up To formats only those characters that precede this character.
- Select a style and click the up button ▲ or down button ▼ to change the order of the styles in the list. The order of the styles determines the sequence in which the formatting is applied. The formatting defined by the second style begins where the formatting of the first style concludes. If you apply a character style to the drop cap, the drop-cap character style acts as the first nested style.

Create nested line styles

You can apply a character style to a specified number of lines in a paragraph. As with nested styles, you can set up two or more nested line styles to work together, and you can create a repeating sequence.

Attributes applied by nested line styles can co-exist with attributes applied by nested styles. For example, a nested line style can apply a color while a nested style can apply italics. If both set conflicting settings of the same attribute, such as red and blue, the nested style takes precedence over the nested line style.

- 1 Create one or more character styles that you want to use to format text.
- 2 Do one of the following:
 - To add nested line styles to a paragraph style, double-click the paragraph style, and then click Drop Caps And Nested Styles.
 - To add nested line styles to a single paragraph, choose Drop Caps And Nested Styles from the Paragraph panel menu.
- 3 Click New Nested Line Style one or more times.
- 4 Click the character style area, and then select a character style to determine the appearance of that section. If you haven't created a character style, choose New Character Style and specify the formatting you want to use.
- 5 Specify the number of paragraph lines you want the character style to affect.

Select a style and click the up button ▲ or down button ▼ to change the order of the styles in the list. The order determines the sequence in which the formatting is applied.
- 6 Click OK.

Loop through nested styles

You can repeat a series of two or more nested styles throughout a paragraph. A simple example would be to alternate red and green words in a paragraph. Or, in nested line styles you could alternate red and green lines in a paragraph. The repeating pattern remains intact even if you add or remove words in the paragraph.

- 1 Create the character styles you want to use.
- 2 Edit or create a paragraph style, or place the insertion point in the paragraph you want to format.
- 3 In the Drop Caps And Nested Styles section or dialog box, click New Nested Style (or New Nested Line Style) at least twice and choose settings for each style.

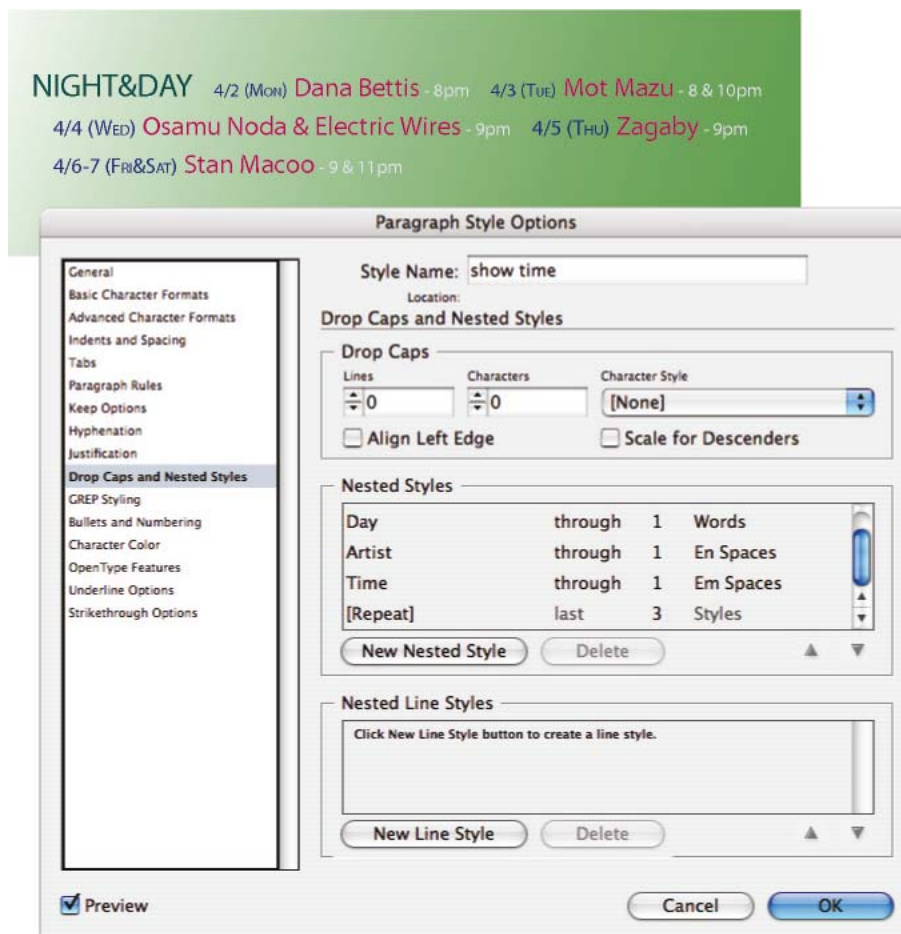

Styles

4 Do either of the following:

- For nested styles, click New Nested Style again, choose [Repeat] in the character style area, and specify how many nested styles will be repeated.
- For nested line styles, click New Nested Line Style again, choose [Repeat] in the character style area, and specify how many lines will be repeated.

In some cases, you may want to skip the first style or styles. For example, an events calendar paragraph may include “This Week’s Events” followed by days of the week and their events. In this case, you could create five nested styles: one for “This Week’s Events,” one each for the day, event, and event time, and a final style with a [Repeat] value of 3, thereby excluding the first nested style from the loop.

The [Repeat] item should be the last in the list. Any nested style below [Repeat] is ignored.

5 Click OK.

Nested style character style options

To determine how a nested character style ends, select any of the following:

Styles

 *If you don't want the character to be included in the nested style formatted, choose Up To instead of Through when you define the nested style.*

Sentences Periods, question marks, and exclamation points indicate the end of a sentence. If a quotation mark follows the punctuation, it is included as part of the sentence.

Words Any space or white space character indicates the end of a word.

Alphabet The endpoint for Arabic numerals is defined by a space. For double-byte characters, it is the same as for letters.

Characters Any character other than zero-width markers (for anchors, index markers, XML tags and so on) is included.

***Note:** If you select Characters, you can also type a character, such as a colon or a period, to end the nested style. If you type multiple characters, any of those characters will end the style. For example, if your run-in headings end with a hyphen, colon, or question mark, you can type -:? to end the nested style where any of these characters appears.*

Letters Any character that does not include punctuation, white space, digits, and symbols.

Digits The Arabic numerals 0–9 are included.

End Nested Style Character Extends the nested style up to or through the appearance of the End Nested Style character you insert. To insert this character, choose Type > Insert Special Character > Other > End Nested Style Here.

Tab Characters Extends the nested style up to or through the tab character (not the tab setting).

Forced Line Break Extends the nested style up to or through the forced line break. (Choose Type > Insert Break Character > Forced Line Break.)

Indent To Here Character Extends the nested style up to or through the Indent To Here character. (Choose Type > Insert Special Character > Other > Indent To Here.)

Em Spaces, En Spaces, or Non-breaking Spaces Extends the nested style up to or through the space character. (Choose Type > Insert White Space > [space character].)

Anchored Object Marker Extends the nested style up to or through an inline graphic marker, which appears where an inline graphic is inserted.

Auto Page Number / Section Marker Extends the nested style up to or through the page number or section name marker.

End a nested style

In most cases, a nested style ends where the condition of the defined style is met, such as after three words or where a period appears. However, you can also end a nested style before the condition is met using the End Nested Style Here character.

- 1 Place the insertion point where you want the nested style to end.
- 2 Choose Type > Insert Special Character > Other > End Nested Style Here.

This character ends the nested style at that point, regardless of the nested style definition.

Remove the formatting of a nested style

- In the Drop Caps And Nested Styles dialog box, or in the Drop Caps And Nested Styles section of the Paragraph Style Options dialog box, select the nested style and click Delete.
- Apply a different paragraph style.

Create GREP styles

GREP is an advanced, pattern-based search technique. You can use GREP styles to apply a character style to text that conforms to the GREP expression you specify. For example, suppose you want to apply a character style to all the phone numbers in text. When you create a GREP style, you select the character style and specify the GREP expression. All paragraph text that matches the GREP expression is formatted with the character style.

A Character style B GREP expression

- 1 Do one of the following:
 - To apply GREP styling to individual paragraphs, select the paragraphs and choose Grep Styles from the Paragraph or Control panel menu.
 - To apply GREP styling to individual paragraphs, select the paragraphs and choose Grep Styles from the Paragraph panel menu.
 - To use GREP styles in a paragraph style, create or edit a paragraph style, and click the GREP Styling tab on the left side of the Paragraph Style Options dialog box.
- 2 Click New GREP Style.
- 3 Click to the right of Apply Style, and then specify a character style. If you haven't created a character style to use, choose New Character Style and specify the formatting you want to use.
- 4 Click to the right of To Text and do any of the following to construct a GREP expression:
 - Enter the search expression manually.
 - Click the Special Characters For Search icon to the right of the To Text field. Choose options from the Locations, Repeat, Match, Modifiers, and Posix submenus to help construct the GREP expression.
- 5 Click OK.

Chapter 7: Typography

Bullets and numbering

Create bulleted or numbered lists

In bulleted lists, each paragraph begins with a bullet character. In numbered lists, each paragraph begins with an expression that includes a number or letter and a separator such as a period or parenthesis. The numbers in a numbered list are updated automatically when you add or remove paragraphs in the list. You can change the type of bullet or numbering style, the separator, the font attributes and character styles, and the type and amount of indent spacing.

You cannot use the Type tool to select the bullets or numbers in a list. Instead, edit their formatting and indent spacing using the Bullets And Numbering dialog box, the Paragraph panel, or the Bullets And Numbering section of the Paragraph Styles dialog box (if the bullets or numbers are part a style).

CHERRY COBBLER	
Filling Ingredients	Cooking Instructions
<ul style="list-style-type: none"> • 4 cups pitted red cherries • 2/3 cup sugar • 2 tablespoons corn starch • 2 tablespoons orange juice 	<ol style="list-style-type: none"> 1. Mix the cherries, sugar, corn starch and orange in a large saucepan. 2. Cook on medium heat until the mixture comes to a full boil, then let it stand for about 10 minutes to thicken, stirring a couple of times during the cooling. 3. Transfer to a shallow baking dish.
	

A quick way to create a bulleted or numbered list is to type the list, select it, and then click the Bulleted List or Numbered List button in the Control panel. These buttons let you turn the list on or off and switch between bullets and numbers. You can also make bullets and numbering part of a paragraph style and construct lists by assigning styles to paragraphs.

Note: Automatically generated bullet and number characters aren't actually inserted in the text. Therefore, they cannot be found during a text search or selected with the Type tool unless you convert them to text. In addition, bullets and numbering don't appear in the story editor window (except in the paragraph style column).

Typography

InDesign Docs provides a series of articles about using bullets and numbering to create [outlines](#), [multi-level lists](#), [figure captions](#), and [numbered steps](#).

- 1 Select the set of paragraphs that will become the list, or click to place the insertion point where you want the list to begin.
- 2 Do any of the following:
 - Click the Bulleted List button  or the Numbered List button  in the Control panel (in Paragraph mode). Hold down Alt (Windows) or Option (macOS) while clicking a button to display the Bullets And Numbering dialog box.
 - Choose Bullets And Numbering from the Paragraph panel or Command panel. For List Type, choose either Bullets or Numbers. Specify the settings you want, and then click OK.
 - Apply a paragraph style that includes bullets or numbering.
- 3 To continue the list in the next paragraph, move the insertion point to the end of the list and press Enter or Return.
- 4 To end the list (or list segment, if the list is to be continued later in the story), click the Bulleted List or Numbered List button in the Control panel again, or choose Bullets And Numbering from the Paragraph panel menu.

Format a bulleted or numbered list

- 1 Using the Type tool , select the bulleted or numbered paragraphs you want to reformat.
- 2 Do any of the following to open the Bullets And Numbering dialog box:
 - Choose Bullets And Numbering from the Control panel menu (in Paragraph mode) or the Paragraph panel menu.
 - Alt-click (Windows) or Option-click (macOS) either the Bulleted List button  or the Numbered List button .
- 3 In the Bullets And Numbering dialog box, do any of the following:
 - Change the bullet character.
 - Change the numbered list options.
 - Choose a style for the numbers or bullets from the Character Style list.
- 4 To change the position of the bullet or number, specify any of the following:

Alignment Left-aligns, centers, or right-aligns the bullets or numbers within the horizontal space allotted for numbers. (If this space is narrow, the difference between the three options is negligible.)

Left Indent Specifies how far the lines after the first line are indented.

First Line Indent Controls where the bullet or number is positioned.

Increase the First Line Indent value if you want the punctuation in long lists to be aligned. For example, if you want “9.” and “10.” to be aligned on the period, change the Alignment to Right and gradually increase the first line indent until the numbers align (make sure Preview is turned on).

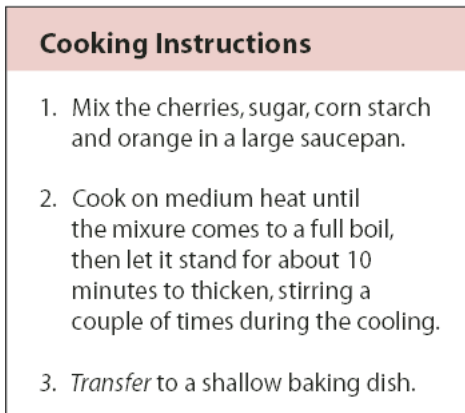

To create the hanging indent effect, specify a positive Left Indent value (such as 2p0), and then specify an equal negative value (such as -2p0) for First Line Indent.

Note: *The Left Indent, First Line Indent, and Tab Position settings in the Bullets And Numbering dialog box are paragraph attributes. For that reason, changing these settings in the Paragraph panel also changes bulleted and numbered list formats*

Tab Position Activates the tab position to create space between the bullet or number and the start of the list item.

By default, bullets and numbers inherit some of their text formatting from the first character in the paragraph to which they're attached. If the first character in one paragraph is different from the first characters in other paragraphs, the numbering or bullet character may appear inconsistent with the other list items. If this is not the formatting you desire, create a character style for numbers or bullets and apply it to your list by using the Bullets And Numbering dialog box.

Change bullet characters

If you don't want to use one of the existing bullet characters, you can add other bullet characters to the Bullet Character grid. A bullet character that is available in one font may not be available in another font. You can choose whether the font is remembered with any bullet character you add.

If you want to use a bullet found in a specific font (such as the pointing hand from Dingbats), be sure to set the bullet to remember that font. If you use a basic bullet character, it's probably best not to remember the font, because most fonts have their own version of that bullet character. Depending on whether you select the Remember Font With Bullet option, a bullet you add can reference either a Unicode value and a specific font family and style, or just a Unicode value.

Note: *Bullets that reference only the Unicode value (without a remembered font) appear with a red "u" indicator.*

Typography

A Bullet without remembered font B Bullet with remembered font

Change the bullet character

- 1 On the Control panel menu or Paragraph panel menu, select Bullets And Numbering.
- 2 In the Bullets And Numbering dialog box, select Bullets from the List Type menu.
- 3 Select a different bullet character, and then click OK.

Add a bullet character

- 1 In the Bullets And Numbering dialog box, select Bullets from the List Type menu, then click Add.
- 2 Select the glyph that you want to use as the bullet character. (Different font families and font styles contain different glyphs.)
- 3 If you want the new bullet to remember the currently chosen font and style, select Remember Font With Bullet.
- 4 Click Add.

Note: The list of bullet characters is stored in the document, like paragraph and character styles. When you paste or load paragraph styles from another document, any bullet character used in those styles appears in the Bullets And Numbering dialog box, along with the other bullets defined for the current document.

Remove a bullet character

- 1 In the Bullets And Numbering dialog box, select Bullets from the List Type menu.
- 2 Select the bullet character you want to remove, and click Delete. (The first preset bullet character cannot be deleted.)

Change numbered list options

In a numbered list, the numbers are updated automatically when you add or remove paragraphs in the list. Paragraphs that are part of the same list are numbered sequentially. These paragraphs do not have to be consecutive to one another as long as you define a list for the paragraphs.

You can also create a multi-level list, in which list items are numbered in outline form and are indented by different degrees.

- 1 Open the Bullets And Numbering dialog box.
- 2 Under Numbering Style, select the type of numbering you want to use from the Format menu.
- 3 In the Number box, use the default expression—period (.) and tab space (^t)—or construct a number expression of your own. To enter a number expression, delete the period after the number metacharacter (^#) and do one of the following:
 - Type a character (such as a closing parenthesis) or more than one character in place of the period.

 You can also input a full-width separator instead of a half-width period separator, which is especially useful for vertical text.

- Choose an item (such as Em Dash or Ellipses) from the Insert Special Character menu.
 - Type a word or character before the number metacharacter. For example, to number questions in a list, you can type the word Question.
- 4 Choose a character style for the expression. (The style you choose applies to the entire number expression, not just to the number.)
 - 5 For Mode, choose one of the following options:
 - Continue From Previous Number** Numbers lists sequentially.
 - Start At** Starts numbering at a number or other value that you enter in the text box. Enter a number, not a letter, even if your list uses letters or Roman numerals for numbering.
 - 6 Specify any other options, and then click OK.

Defining lists

A defined list can be interrupted by other paragraphs and lists, and can span different stories and different documents in a book. For example, use defined lists to create a multi-level outline, or to create a running list of numbered table names throughout your document. You can also define lists for separately numbered or bulleted items that are mixed together. For example, in a list of questions and answers, define one list for numbering the questions and another for numbering the answers.

Defined lists are often used to track paragraphs for numbering purposes. When you create a paragraph style for numbering, you can assign the style to a defined list, and paragraphs are numbered in that style according to where they appear in the defined list. The first paragraph to appear is given number 1 (“Table 1”), for example, and the next paragraph is given number 2 (“Table 2”), even if it appears several pages later. Because both paragraphs belong to the same defined list, they can be numbered consecutively no matter how far apart they are in the document or book.

Define a new list for each type of item you want to number—step-by-step instructions, tables, and figures, for example. By defining multiple lists, you can interrupt one list with another and maintain number sequences in each list.

 If list items appear in unthreaded frames on the same page, items are numbered in the order in which the text frames are added to the page. To reorder the items, cut and paste the text frames one by one in the order in which you want them to be listed.

5. Stories of Dessert

5.1 Pineapple Cake

WHAT YOU NEED

- 1 orange chiffon cake or angel food cake
- 4 oz. instant vanilla pudding mix
- 12 oz. can crushed pineapple
- 1/2 oz. whipped cream

DIRECTIONS

1. Slice cake horizontally in three layers.
2. Mix pudding, pineapple, and cream.
3. Keep in refrigerator for an hour before serving.

Define a list

- 1 Choose Type > Bulleted And Numbered Lists > Define Lists.
- 2 Click New in the Define Lists dialog box.
- 3 Enter a name for the list, choose whether you want to continue numbering across stories, and continue numbering from previous documents in your book.
- 4 Click OK twice.

After you define a list, you can use it in a paragraph style, such as a style for tables, figures, or ordered lists, as well as apply it by way of the Control panel and Paragraph panel.

Note: Some lists are defined automatically. For example, when you import a numbered list from a Microsoft Word document, InDesign defines a list automatically for your document.

Edit a defined list

- 1 Choose Type > Bulleted And Numbered Lists > Define Lists.
- 2 Select a list and click Edit.
- 3 Enter a new name for the list or change your selection of Continue Numbers options.

Paragraph styles that are assigned to the list are reassigned to the list under its new name.

Delete a defined list

- 1 Choose Type > Bulleted And Numbered Lists > Define Lists.
- 2 Select a list.
- 3 Click Delete, and then select a different list or the [Default] list to replace your list with.

Create a paragraph style for running lists

To create a *running list*—a list that is interrupted by other paragraphs or that spans multiple stories or documents—create a paragraph style and apply the style to paragraphs that you want to be part of the list. For example, to create a running list of the tables in your document, create a paragraph style called Tables, make a defined list part of the style, and then apply the Tables paragraph style to all paragraphs you want in your Table list.

- 1 Choose New Paragraph Style from the Paragraph Styles panel menu.
- 2 Enter a style name.
- 3 On the left side of the New Paragraph Style dialog box, click Bullets And Numbering.
- 4 For List Type, select Bullets or Numbering.
- 5 If you are creating a style for numbered lists, choose a defined list from the List menu, or choose New List and define the list.
- 6 Specify the bullet or numbering characteristics.
- 7 Use the Bullet or Number Position section of the New Paragraph Style dialog box to change the indent spacing. For example, to create a hanging indent, type 2p for Left Indent and -2p for First Line Indent.
- 8 Specify other paragraph style attributes for the style, and then click OK.

Create multi-level lists

A *multi-level list* is a list that describes hierarchical relationships between the list paragraphs. These lists are also called *outline lists* because they resemble outlines. The list's numbering scheme (as well as indentations) show rank as well as how items are subordinate to one another. You can tell where each paragraph fits in the list with respect to the paragraphs before and after it. You can include up to nine levels in a multi-level list.

Typography

<p>4. History of Dessert</p> <p>4.1. European</p> <p>4.2. American</p> <p>4.3. Ethnic</p> <p>5. Stories of Dessert</p> <p>5.1. Pineapple Cake</p> <p>A. What You Need</p> <p>B. Directions</p> <p>C. Story: Brian's</p> <p>a. Figure 1</p> <p>b. Figure 2</p> <p>5.2. Cherry Cobbler</p> <p>A. What You Need</p> <p>B. Directions</p> <p>C. Story: Grandma Flora's</p> <p>a. Figure 1</p> <p>b. Figure 2</p> <p>6. Index of Must Taste</p>	<p>Outline Level 1</p> <p>Outline Level 2</p> <p>Outline Level 2</p> <p>Outline Level 2</p> <p>Outline Level 1</p> <p>Outline Level 2</p> <p>Outline Level 3</p> <p>Outline Level 3</p> <p>Outline Level 3</p> <p>Outline Level 4</p> <p>Outline Level 4</p> <p>Outline Level 2</p> <p>Outline Level 3</p> <p>Outline Level 3</p> <p>Outline Level 3</p> <p>Outline Level 4</p> <p>Outline Level 4</p> <p>Outline Level 1</p>
---	---

To create a multi-level list, define the list and then create a paragraph style for each level you want. For example, a list with four levels requires four paragraph styles (each one assigned the same defined list). As you create each style, you define its numbering format and paragraph formatting.

- 1 Choose New Paragraph Style from the Paragraph Styles panel menu.
- 2 Enter a style name.
- 3 If you already created a style for your multi-level list, choose the style you will assign to levels above this one from the Based On menu; otherwise, choose No Paragraph Style or Basic Paragraph.
- 4 On the left side of the New Paragraph Style dialog box, click Bullets And Numbering.
- 5 Choose Numbers from the List Type menu.
- 6 Choose a list you defined from the List menu. If you haven't yet defined your list, you can choose New List from the menu and define it now.
- 7 In the Level box, enter a number that describes which level of the multi-level list you're creating a style for.
- 8 From the Format menu, choose the type of numbering you want to use.
- 9 In the Number box, enter metacharacters or select metacharacters from the menus to describe the number formatting you want for list items at this level.
 - To include numbering prefixes from higher levels, enter text or click at the start of the Number box and choose Insert Number Placeholder and then select a Level option (for example, Level 1), or enter ^ and then the list level (for example, enter ^1). In a list with first levels numbered 1, 2, 3, and so on, and second levels numbered a, b, c, and so on, including the first-level prefix in the second level renders second-level numbers as 1a, 1b, 1c; 2a, 2b, 2c; 3a, 3b, 3c.
 - To create a number expression, enter punctuation, enter metacharacters, or select options on the Insert Special Character list.
- 10 Select Restart Numbers At This Level After to renumber beginning at 1 when a paragraph at this level appears after a paragraph at a higher level; deselect this option to number paragraphs at this level consecutively throughout the list without regard for where the paragraphs appear in the list hierarchy.

Typography

To restart numbers after a specific level or range of levels, type the level number or range (such as 2-4) in the Restart Numbers At This Level After field.

11 In the Bullet or Number Position area, choose Indent or Tab Position options to indent list items at this level farther than list items at higher levels. Indenting helps subordinate items in lists stand out.

12 Click OK.

In some cases, such as with numbered steps, you may want to restart numbering within the same story. To avoid restarting the numbered list manually, create a separate style that's identical to the Level 1 style with one exception. For Mode, chose Start At, and then specify 1. Name this style something like "Level 1 Restart."

Create running captions for figures and tables

Running captions number figures, tables, and other items consecutively in a document. For example, the first figure caption starts with the words "Figure 1," the second with "Figure 2," and so on. To make sure that figures, tables, or similar items are numbered consecutively, define a list for the item, and then create a paragraph style that includes the list definition. You can also add descriptive words such as "Figure" or "Table" to the numbering scheme of the paragraph style.

List items are numbered in the order in which they are added to the page. To reorder the items, cut and paste the items one by one in the order in which you want them to be listed.

1 Create a new paragraph style and, in the Bullets And Numbering section of the Paragraph Style Options dialog box, choose Numbers from the List Type menu.

2 Choose a defined list from the List menu (or choose New List to define a list).

3 Under Numbering Style, select the type of numbering you want to use from the Format menu.

For example, select the A, B, C, D... option to create a list for "Figure A," "Figure B," and so on.

4 In the Number box, enter a descriptive word and any spacing or punctuation (as needed) along with the numbering metacharacters.

For example, to create a "Figure A" effect, enter the word "Figure" and a space before the numbering metacharacters (such as Figure ^#.^t). This adds the word "Figure" followed by a sequential number (^#), a period, and a tab (^t).

Note: To include chapter numbers in running captions, choose Insert Number Placeholder > Chapter Number from the Number list, or enter ^H where you want the chapter number to appear in the number scheme.

5 Finish creating the style and click OK.

After you create the style, apply it to text figure captions or table titles.

You can use the Table Of Contents feature to generate a list of tables or figures.

Restart or continue numbering for a list

InDesign offers commands for restarting a list and continuing a list:

Restarting a numbered list Place the insertion point in the paragraph and choose Restart Numbering from the context menu or choose Type > Bulleted And Numbered Lists > Restart Numbering. In normal lists, this command assigns the number 1 (or letter A) to a paragraph and makes it the first paragraph in a list. In multi-level lists, this command assigns the first lower-level number to a nested paragraph.

Continuing a numbered list Choose Continue Numbering from the context menu or choose Type > Bulleted And Numbered Lists > Continue Numbering. This command resumes numbering a list that was interrupted by commentary, graphics, or nested list items. InDesign also offers commands for numbering lists that begin in one story or book and cross into the next story or book.

Number a list from the previous or current story

Whether a list resumes numbering from the previous story or starts numbering anew in the current story depends on how the list is defined.

- 1 Choose Type > Bulleted And Numbered Lists > Define Lists.
- 2 Select a list and click the Edit button.
 - Don't choose the Default list because it can't run across stories.
- 3 Select Continue Numbers Across Stories to resume numbering the list from the previous story, or deselect this option to start the list in the current story at 1 (or A).
- 4 Click OK twice.

Number a list from the previous or current document in a book

Whether a list resumes numbering from the previous document in a book or starts numbering anew in the current document depends on how the list is defined.

- 1 Choose Type > Bulleted And Numbered Lists > Define Lists.
- 2 Select a list and click the Edit button.
- 3 Select Continue Numbers From Previous Document In Book to resume numbering the list from the previous document (you must choose Continue Numbers Across Stories to activate this option), or deselect this option to start the list in the current document at 1 (or A).
- 4 Click OK twice.

To make sure that numbering is updated properly in a book, synchronize the documents in the book and choose Update Numbering > Update All Numbers from the books panel menu.

Convert list bullets or numbers to text

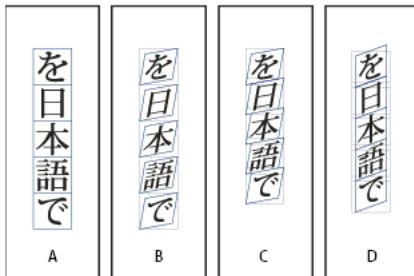

- 1 Select the paragraphs containing the bulleted or numbered list.
- 2 Do one of the following:
 - From the Paragraph panel menu, choose Convert Numbering To Text or Convert Bullets To Text.
 - Right-click (Windows) or Command-click (macOS) the selection, and then choose Convert Numbering To Text or Convert Bullets To Text.

Note: *To remove the list numbers or bullets, click the Numbered List button or Bulleted List button to unapply list formatting to the selected text.*

Formatting CJK characters

Apply shatai to text

In traditional typesetting technology, characters were slanted by using a lens to distort the glyphs when being set on film. This oblique style is known as *shatai*. Shatai is distinct from a simple slant of the glyphs, because it also scales the glyphs. You can adjust the magnification or angle of text you want to slant from the center point, without changing the height of the glyph, using the shatai feature in InDesign.

A No scale applied B Magnification 30%, 45 shatai C Selecting the Adjust Tsume option D Selecting the Adjust Rotation option

- 1 Select text.
- 2 Select Shatai from the Character panel menu or Control panel menu.
- 3 Specify the following options, and click OK:
 - Specify the degree of skew in Magnification (In traditional typesetting technology terms, 10% magnification is lens 1, and 40% magnification is lens 4).
 - Set the angle of obliqueness to 30, 45, or 60, in Angle.
 - Select Adjust Rotation to rotate the glyphs, and display horizontal lines horizontally for horizontal text, and vertical lines vertically for vertical text.
 - Select Adjust Tsume to apply jidori.

You can fine tune the rotated oblique effect for individual characters, after applying shatai to text.

Rotate characters

- 1 Select the characters.
- 2 In the Character panel, type a value for Character Rotation  Specify a minus value to rotate the character to the right (clockwise).

Adjust aki before and after characters

- 1 Select opening parenthesis or closing parenthesis with the type tool.

Typography

- 2 Choose the amount of aki you want to add from the Mojikumi Before Character  or Mojikumi After Character  pop-up menu, in the Character panel.

For example, if you specify 2bu, half a full-width space is added, and if you specify 4bu, a quarter of a full-width space is added. This aki will not be adjusted when the line is set to full justification. Adjusting aki is especially useful to override Mojikumi Akiryo Settings for certain characters.

Use tate-chu-yoko

Using tate-chu-yoko (also known as kumimoji or renmoji) is an option to make a part of the text horizontal, in vertical text. It is easier to read half-width characters such as numbers, dates, and short foreign words in a vertical text frame, by rotating the text.

You can move text left, right, up, and down when you turn on the Tate-chu-yoko option. You can also set Auto Tate-chu-yoko for special half-width characters. Auto Tate-chu-yoko is set in the paragraph attributes.

 Use *tsume* or tracking in the Character panel to adjust the character spacing for Tate-chu-yoko.

Apply tate-chu-yoko

- 1 Select the text to which you want to apply tate-chu-yoko.
- 2 Do one of the following:
 - Choose Tate-chu-yoko from the Character panel menu or Control panel menu.
 - Choose Tate-chu-yoko Settings from the Character panel menu or Control panel menu, choose Tate-chu-yoko in the Tate-chu-yoko dialog box, and click OK.

 If multiple instances of tate-chu-yoko appear next to each other, use the Non-joiner character to keep them separate. Choose *Type > Insert Special Character > Other > Non-joiner*.

Remove tate-chu-yoko

- 1 Select the text to which you want to apply tate-chu-yoko.

Typography

2 Do one of the following:

- Choose and cancel Tate-chu-yoko from the Character panel menu or Control panel menu.
- Choose Tate-chu-yoko Settings from the Character panel menu, deselect Tate-chu-yoko in the Tate-chu-yoko dialog box, and then click OK.

Change tate-chu-yoko settings

- 1 Choose Tate-chu-yoko Settings from the Character panel menu.
- 2 Specify a value for moving the text up or down in X Offset. If you specify a plus value, the text will move up, and if you specify a minus value, it will move down.
- 3 Specify a value for moving the text left or right in Y Offset. If you specify a plus value, the text will move to the right, and if you specify a minus value, it will move to the left.

Set Auto Tate-chu-yoko for specific paragraphs

- 1 Select the text to be set to Auto Tate-chu-yoko, or place the text insertion point in the paragraph.
- 2 Choose Auto Tate-chu-yoko from the Paragraph panel menu.
- 3 In KumiNumber, specify the number of successive half-width characters that you want to rotate to vertical orientation. For example, if this is set to 2, the character string "123" will not rotate, while "12" will.
- 4 If you want to apply tate-chu-yoko to roman text, select Include Roman Characters, and click OK.

Add Ruby to text

In Japanese, Ruby (also known as *furigana*) is normally used to show the kanji yomi in hiragana. In Simplified Chinese, Ruby is called Pinyin, while in Traditional Chinese, Ruby is called Chuyin. InDesign provides full support to Japanese Ruby and limited support to Chinese Pinyin or Chuyin. You can adjust Ruby settings to specify Ruby location, size, or color. Furthermore, when the ruby is longer than the parent you can specify the ruby distribution. You can also apply tate-chu-yoko to Ruby.

When the parent to which you want to attach ruby covers two lines, the ruby will follow when the parent moves to the next line.

Note: In some instances, such as when applying a style that includes a variable, Ruby characters may be removed.

- 1 Select the text to which you want to attach ruby. You cannot attach ruby when there are forced line breaks in the selected text.
- 2 Select Ruby > Ruby from the Character panel menu or Control panel menu.
- 3 Enter the ruby characters in Ruby.
- 4 Change Ruby settings by clicking an option on the left side of the dialog box and specifying settings.
- 5 Click OK.

Ruby settings

The following options appear in the different panels of the Ruby dialog box.

Ruby Placement and Spacing

- From the Type menu, choose Per-Character or Group Ruby. When Per Character Ruby is selected, enter a half or full width space when inputting Ruby characters to separate them in line with their parent characters. For "hakunetsutou" for example, enter as "haku netsu tou" (example of a word composed of Japanese characters and its phonetic spelling is given).

- From the Alignment menu, specify the position of the Ruby characters. You can check the position with the graphic shown in the sample field.
- To attach ruby above horizontal text or to the right of vertical text, select Above/Right, and to attach below horizontal text or to the left of vertical text, select Below/Left in Placement.
- Specify the spacing between the ruby and the parent in XOffset and YOffset. When you enter a minus value, the ruby moves closer to the parent.

Ruby Font and Size

- Select a font family and font style in Font.
- Specify the size of the ruby characters in Size. The default ruby size is half the size of the parent.
- Specify the scale for the height and width of the ruby characters in Horizontal Scale and Vertical Scale.
- Select Use Open Type Pro Ruby Glyphs to use alternate glyphs for ruby (when possible). Specific kana characters are available for some Open Type Pro fonts. When you select this option, the specific font for ruby characters, and not the standard kana font, will be used.
- In KumiNumber, specify the number of successive half-width characters that you want to rotate to vertical orientation. For example, if this is set to 2, the character string "123" will not rotate, while "12" will.
- Select Include Roman Characters to apply tate-chu-yoko to roman text.
- Select Scale to Fit to force the tate-chu-yoko to have the same dimensions (1 em x 1 em) in the ruby string, either using an OpenType feature or scaling the glyphs.

Adjustment When Ruby Is Longer Than Parent

- With Overhang, when the total Ruby width is greater than that of their parent characters, the specified Ruby will overflow widthways into the space above characters either side of the parents. For Japanese, character types compatible with Overhang comply with the JISx4051-1995 specification.
- Specify the parent character spacing necessary for attaching ruby in Spacing. When you select a different option, the graphics displayed in the sample field are updated.
- To automatically adjust the ruby character width, select Char Width Scaling, and specify the compression scale for the width of the ruby characters.

Typography

- Select Auto Align at Line Edges to align the parent with the start and end of the line.

Ruby Color

- Select a color swatch in the list box.
- Specify the degree of tinting and line weight, as necessary.
- Select Overprint Fill or Overprint Stroke to set filling or stroke overprint for ruby characters.

Apply kenten

Kenten (also known as *Boten*) are points which you attach to text you want to highlight. You can select the type of points from existing kenten forms, or specify customized kenten characters. You can also specify the position, scale, and color by adjusting the kenten settings.

Apply kenten

- 1 Choose the characters you want to highlight.
- 2 Choose a kenten character, such as Fisheye or White Circle, from Kenten in the Character panel menu or Control panel menu.

Change kenten settings and color

- 1 Choose Kenten > Kenten from the Character panel menu or Control panel menu.
- 2 For Kenten Settings, specify the options below:
 - Kenten Type** Select a kenten character, such as Fisheye or White Circle. Choose Custom to specify a custom character. You can enter characters directly, or you can specify a character code value for the specified character set.
 - Position** Specify the spacing between the kenten and characters.
 - Location** Select Above/Right to attach kenten above horizontal text or to the right of vertical text, and Below/Left to attach below horizontal text or to the left of vertical text.
 - Size** Specify the size of the kenten character.
 - Align** Specify whether the kenten should be displayed in the center (Center) or to the left (Left) (above for vertical text) of the character's embox.
 - H/Scale and V/Scale** Specify the scale for the height and width of the kenten character.
- 3 To change the color of the kenten, choose Kenten Color from the list box, and then specify the options below:
 - Select a color swatch from the list box.
 - Specify the degree of tinting and line weight, as necessary.
 - Select Overprint Fill or Overprint Stroke to set filling or stroke overprint for kenten characters.
- 4 Click OK.

Align text of different sizes

You can specify how to align text to the largest characters in a line using the Character Alignment option, when positioning characters of different sizes in 1 line. It is possible to align characters to the top, center or bottom of the embox (right, center, and left for vertical frames), to the roman baseline, and to the top or bottom of the ICF box (right or left for vertical frames). *ICF* (Ideographic Character Face) is the average height and width used by the font designer to design the ideographic characters which comprise a font.

A Align different size letters above full space letters **B** Align different size letters in the middle of full space letters **C** Align different size letters below full space letters

Note: The Character Alignment option is not effective, even if applied, when all characters are the same size in a line.

- 1 Select a range of text or lines for the characters you want to align, or select a text frame using the selection tool.
- 2 Choose one of the following options from Character Alignment in the Character panel menu or Control panel menu.
 - Roman Baseline aligns the small characters in a line to the large character baseline grid.
 - Embox Top/Right, Center, or Embox Bottom/Left align the small characters in a line to the specified position of the large characters embox. In vertical text frames, Embox Top/Right aligns the text to the right of the embox, and Embox Bottom/Left aligns the paragraph to the left of the embox.
 - ICF Top/Right and ICF Bottom/Left align the small characters in a line to the ICF specified by the large characters. In vertical text frames, ICF Top/Right aligns the text to the right of the ICF, and ICF Bottom/Left to the left of the ICF.

Using fonts

About fonts

A *font* is a complete set of characters—letters, numbers, and symbols—that share a common weight, width, and style, such as 10-pt Adobe Garamond Bold.

Typography

Typefaces (often called *type families* or *font families*) are collections of fonts that share an overall appearance, and are designed to be used together, such as Adobe Garamond.

A *type style* is a variant version of an individual font in a font family. Typically, the *Roman* or *Plain* (the actual name varies from family to family) member of a font family is the base font, which may include type styles such as regular, bold, semibold, italic, and bold italic.

For CJK-language fonts, the font style name is often determined by the variation in thickness (also called weight). For example, the Japanese font Kozuka-Mincho Std includes six weights: Extra Light, Light, Regular, Medium, Bold and Heavy. The font style name which is displayed depends on the font manufacturer. Each font style is a stand-alone file. If the font style file has not been installed, that font style cannot be selected from Font Style.

Installing fonts

When you install InCopy or Adobe Creative Cloud, fonts are automatically installed in the system fonts folder.

- Windows: On Windows the fonts are located in the “\Windows\Fonts” folder. For example, c:\Windows\Fonts
macOS: On Mac, the fonts are located in the “/Library/Fonts”

Fonts are also available from fonts.adobe.com, as part of your Creative Cloud. For information on installing and activating fonts to be used in all applications, see your system documentation or your font manager documentation.

You can make fonts available in InCopy by copying the font files into the Fonts folder inside the InDesign application folder on your hard drive. However, fonts in this Fonts folder are available only to InCopy.

Duplicate fonts are listed in the menus with their font technologies abbreviated in parentheses. For example, a Helvetica TrueType font appears as “Helvetica (TT),” a Helvetica PostScript Type 1 font appears as “Helvetica (T1),” and a Helvetica OpenType font appears as “Helvetica (OTF).” If two fonts have the same PostScript name and one includes .dfont in its name, the other font is used. PostScript T1 is no longer supported since January 2023.

Apply a font to text

When you specify a font, you can select the font family and its type style independently. When you change from one font family to another, InCopy attempts to match the current style with the style available in the new font family. For example, Arial Bold would change to Times Bold when you change from Arial to Times.

When you apply a bold or italic style to type, InCopy applies the typeface style specified by the font. In most cases, the specific version of bold or italic is applied as expected. However, some fonts may apply a bold or italic variation that isn’t exactly labeled bold or italic, respectively. For example, some font designers specify that when you apply bold to a font, the semibold variation is applied.

When applying a Roman font to text containing both CJK and Roman characters, a message is displayed to indicate that this operation will only apply to and override Roman text. By selecting text containing both CJK and Roman characters, and pressing Ctrl+Alt (Windows) or Command+Option (macOS) while selecting and overriding the Roman font you will apply Roman font to CJK characters, and garbled characters will be displayed.

Furthermore, when you apply a CJK font to text that includes Japanese and Roman characters, the CJK font is applied to the entire text, including the Roman text (CJK fonts without Roman characters will not be applied).

In the Font List displayed in the Character panel and by selecting Type > Font, CJK fonts are displayed before Roman fonts. In addition, when composite fonts have been created and specified, they are displayed above the CJK fonts.

- 1 Select the text you want to change.

Typography

2 Do any of the following:

- In the Character panel or Control panel, select a font in the Font Family menu or a style in the Type Style menu. (In macOS, you can select type styles in the Font Family submenus.)
- In the Character panel or Control panel, click in front of the font family name or type style name (or double-click its first word) and type in the first few characters of the name you want. As you type, InCopy displays font family or type style names that match the characters you've typed.
- Choose a font in the Type > Font menu. Note that you choose both a font family and a type style when you use this menu.

Specify a typeface size

By default, typeface size is measured in *points* (a point equals 1/72 of an inch). You can specify any typeface size from 0.1 to 1296 points, in 0.001-point increments.

- 1 Select the characters or type objects you want to change. If you don't select any text, the typeface size applies to new text you create.
- 2 Do one of the following:
 - In the Character panel or Control bar set the Font Size option.
 - Choose a size from the Type > Size menu. Choosing Other lets you type a new size in the Character panel.

 You can change the unit of measurement for type in the Preferences dialog box. This option is not available in Fireworks.

Previewing fonts

You can view samples of a font in the font family and font style menus in the Character panel and other areas in the application from where you can choose fonts. The following icons are used to indicate different kinds of fonts:

- OpenType 
- Type 1 
- TrueType 
- Multiple Master 
- Composite 

You can turn off the preview feature or change the point size of the font names or font samples in Type preferences.

OpenType fonts

OpenType fonts use a single font file for both Windows® and Macintosh® computers, so you can move files from one platform to another without worrying about font substitution and other problems that cause text to reflow. They may include a number of features, such as swashes and discretionary ligatures, that aren't available in current PostScript and TrueType fonts.

 OpenType fonts display the  icon.

When working with an OpenType font, you can automatically substitute alternate glyphs, such as ligatures, small capitals, fractions, and old style proportional figures, in your text.

Typography

A Ordinals B Discretionary ligatures C Swashes

OpenType fonts may include an expanded character set and layout features to provide richer linguistic support and advanced typographic control. OpenType fonts from Adobe that include support for central European (CE) languages include the word “Pro,” as part of the font name in application font menus. OpenType fonts that don’t contain central European language support are labeled “Standard,” and have an “Std” suffix. All OpenType fonts can also be installed and used alongside PostScript Type 1 and TrueType fonts.

Installing OpenType fonts

InCopy includes fonts from various OpenType families, including Adobe Garamond Pro, Adobe Caslon Pro, Trajan Pro, Cafilisch Script Pro, Myriad Pro, Lithos, and Adobe Jenson Pro.

In addition to Roman Open Type fonts such as Adobe Garamond Pro, Adobe Caslon Pro, Trajan Pro, Cafilisch Script Pro, Myriad Pro, Lithos, and Adobe Jenson Pro, InCopy comes with Japanese Open Type fonts including Kozuka Mincho Pro and Kozuka Gothic Pro.

OpenType fonts are installed automatically when you install InCopy or Adobe Creative Cloud. Additional OpenType fonts are located in the Adobe Fonts folder. For information on installing and using OpenType fonts, browse the Adobe website.

Apply OpenType font attributes

Use the Character panel or Control panel to apply OpenType font attributes, such as fractions and swashes to text.

Apply OpenType font attributes

- 1 Select text.
- 2 In the Character panel or Control panel, make sure that an OpenType font is selected.
- 3 Choose OpenType from the Character panel menu, and then select an OpenType attribute, such as Discretionary Ligatures or Fractions.

Features not supported in the current font appear in square brackets, such as [Swash].

 You can also select OpenType font attributes when defining a paragraph or character style. Use the OpenType Features section of the Style Options dialog box.

OpenType font attributes

When you use an OpenType font, you can select specific OpenType features from the Control panel or Character panel menu when formatting text or when defining styles.

Typography

Note: OpenType fonts vary greatly in the number of type styles and kinds of features they offer. If an OpenType feature is unavailable, it's surrounded in square brackets (such as [Swash]) in the Control panel menu.

Discretionary Ligatures Font designers may include optional ligatures that shouldn't be turned on in all circumstances. Selecting this option allows these additional optional ligatures to be used, if they are present.

Many compound character glyphs for Japanese katakana words, such as “me-toru” and for Kanji compounds, such as “yuugenkaisha,” can be accessed using the discretionary ligature feature.

Fractions Numbers separated by a slash (such as 1/2) are converted to a fraction character, when fractions are available.

Ordinal Ordinal numbers such as *1st* and *2nd* are formatted with superscript letters (1st and 2nd) when ordinals are available. Letters such as the superscript *a* and *o* in the Spanish words *segunda* (2^a) and *segundo* (2^o) are also typeset properly.

Swash When available, regular and contextual swashes, which may include alternate caps and end-of-word alternatives, are provided.

Titling Alternatives When available, characters used for uppercase titles are activated. In some fonts, selecting this option for text formatted in both uppercase and lowercase letters can yield undesired effects.

Contextual Alternatives When available, contextual ligatures and connecting alternates are activated. Alternate characters are included in some script typefaces to provide better joining behavior. For example, the letter pair “bl” in the word “bloom” can be joined so that it looks more like handwriting. This option is selected by default.

All Small Caps For fonts that include real small caps, selecting this option turns characters into small caps.

Slashed Zero Selecting this options displays the number 0 with a diagonal slash through it. In some fonts (especially condensed fonts), it can be difficult to distinguish between the number 0 and the capital letter O.

Stylistic Sets Some OpenType fonts include alternate glyph sets designed for esthetic effect. A *stylistic set* is a group of glyph alternates that can be applied one character at a time or to a range of text. If you select a different stylistic set, the glyphs defined in the set are used instead of the font's default glyphs. If a glyph character in a stylistic set is used in conjunction with another OpenType setting, the glyph from the individual setting overrides the character set glyph. You can see the glyphs for each set using the Glyphs panel.

Positional Forms In some cursive scripts and in languages such as Arabic, what a character looks like can depend on its position inside a word. The character may change form when it appears at the start (initial position), middle (medial position), or end (final position) of a word, and it may change form as well when it appears alone (isolated position). Select a character and choose a Positional Forms option to format it correctly. The General Form option inserts the common character; the Automatic Form option inserts a form of the character according to where the character is located in the word and whether the character appears in isolation.

Superscript/Superior & Subscript/Inferior Some OpenType fonts include raised or lowered glyphs that are sized correctly relative to the surrounding characters. If an OpenType font doesn't include these glyphs for non-standard fractions, consider using the Numerator and Denominator attributes.

Numerator & Denominator Some OpenType fonts convert only basic fractions (such as 1/2 or 1/4) to fraction glyphs, not non-standard fractions (such as 4/13 or 99/100). Apply Numerator and Denominator attributes to these non-standard fractions in such cases.

Tabular Lining Same widths are provided for full-height figures. This option is appropriate in situations where numbers need to line up from one line to the next, as in tables.

Proportional Oldstyle Varying-height figures with varying widths are provided. This option is recommended for a classic, sophisticated look in text that doesn't use all caps.

Typography

Proportional Lining Full-height figures with varying widths are provided. This option is recommended for text that uses all caps.

Tabular Oldstyle Varying-height figures with fixed, equal widths are provided. This option is recommended when you want the classic appearance of old-style figures, but you need them to align in columns, as in an annual report.

Default Figure Style Figure glyphs use the default figure style of the current font.

Use Proportional Metrics Characters are composed using the proportional metrics of the font.

Use H or V Kana For fonts that include Kana for vertical or horizontal writing, Kana glyphs most appropriate for horizontal or vertical settings are provided.

Roman Italics If the font contains italic glyphs, the proportional Roman glyph switches to italic type.

Apply OpenType glyph forms

The Glyphs panel includes a number of options, such as Expert Forms or JIS 90 Forms, that you can apply to selected text.

- 1 Choose Type > Glyphs to open the Glyphs panel.
- 2 Select the character or characters to which you'd like to apply glyph forms.
- 3 Choose an option such as Expert Forms or JIS 90 from the Glyphs panel menu.

Composite fonts

In InDesign, you can mix parts of different fonts and use them as a composite font in InDesign or Adobe InCopy®. Normally this technique is used to mix parts of a roman font and a CJK font. Composite fonts that you've created in InDesign are displayed at the beginning of the font list in InCopy. You can apply these fonts to text, but you cannot create or edit composite fonts in InCopy. For details, see InDesign Help.

Use composite fonts

You can mix parts of different fonts and use them as a composite font. Normally this technique is used to mix parts of a Roman font and a CJK font. You can also add characters to a font. Composite fonts are displayed at the beginning of the font list.

A Character categories B Input menu for each category change C Scale at the center of the character

Create composite fonts

- 1 Choose Type > Composite Font.

Typography

- 2 Click New, enter the name, specify the composite font on which the new composite font will be based, and then click OK.
- 3 Select a category (roman or other), and specify the font attributes under the list box.
 You can specify font attributes by clicking Show Sample to display the sample edit window, and clicking the button on the right to choose Show or Hide for the colored lines that indicate the ICF box, embox, baseline and so on. Furthermore, from the Horizontal Text and Vertical Text options, you can switch the text direction of the sample text and display it horizontally or vertically.
- 4 Click Save to save the settings for the composite font created, and then click OK.

Composite font categories

Fonts are classified in the following categories:

Kanji (or Hangul) Kanji characters are used in Japanese and Chinese. Hangul characters are used in Korean. You cannot edit the size, baseline, vertical scale, or horizontal scale for kanji or hangul.

Kana Specifies fonts used for hiragana and katakana. When you are making composite fonts using a language other than Japanese, use the same font for Kana as you use in your base font.

Punctuation Specifies the font used for punctuation. You cannot edit the size, vertical scale, or horizontal scale for punctuation.

Full Width Symbols Specifies the font used for symbols. You cannot edit the size, vertical scale, or horizontal scale for symbols.

Roman Specifies the font used for half-width roman characters. This is normally a roman font.

Numbers Specifies the font used for half-width numbers. This is normally a roman font.

The font attributes that can be set for composite fonts are as follows:

Units Select the units for font attribute settings.

Size Set the size in relation to the font size used for input. The size may differ for different fonts, even when the same font size is used. You can adjust the size, depending on the fonts used in the composite font.

Baseline Set a baseline for each font.

Vertical scale and horizontal scale Scale the font vertically and horizontally. You can only use these settings for kana, half-width roman characters, and numbers.

Enlarge/Shrink from Center of Character Set whether to scale from the center of the character or the roman baseline, when editing vertical and horizontal scales for kana. If you select this option, the characters will be scaled from the center.

Make custom font settings in a composite font

You can set the font in character units by setting Custom for composite fonts.

- 1 Click Custom in the Composite Font Editor dialog box.
- 2 Do one of the following:
 - If there is an existing character set, select it.
 - Click the New button, enter a name for the character set, choose Custom Set From Based On, and click OK. The following base sets are provided: Hiragana, Katakana, Punctuation, Symbols, Double Byte Numbers, Single Byte Numbers, Single-Byte Gajji 0-11. Using these, you can easily create character sets to meet your requirements. If Based On is not needed, choose None and click OK.

Typography

If you have selected a base set, the characters stored in the selected set will be shown in the Custom Set Edit dialog box. If None is selected, no characters will be displayed.

- 3 Use Font to specify the font to use with the Custom Set. If Single Byte Gaiji is specified as the base set, choose the single byte Gaiji you would like to use.
- 4 To add a glyph directly, choose Direct Entry from the pop-up menu, enter the characters in the text box, and click Add. You can also copy and paste characters directly into the dialog box from the IME panel.
- 5 To enter a code, specify the encoding type (such as Shift-JIS for Japanese) from the pop-up menu, enter the code or hyphenated code range (such as 8169-8174 for Japanese), and click Add.
- 6 Select characters you want to delete. The Add button becomes a Delete button; the selected characters will be deleted when you click Delete.
- 7 If multiple custom sets have been created, choose the edited character set from the Custom Set pop-up menu. You can delete sets that are no longer needed by clicking Delete on the right side of the dialog box.
- 8 When you have completed editing, click Save to save the character and then click OK.
- 9 The custom set that was set in the Composite Font Edit dialog box will be displayed, allowing you to set the composite font.

Note: When there are several custom characters in 1 composite font, the bottom set takes precedence over all the above sets. MM (multiple master) fonts are not displayed in the Composite Font Edit dialog box.

Import composite fonts

- 1 Click Import in the Composite Font Editor dialog box.
- 2 Double-click the InDesign document containing the composite fonts you want to import.

Delete a composite font

- 1 Select the composite font you want to delete in the Composite Font Editor dialog box.
- 2 Click Delete Font, and then click Yes.

Use missing glyph protection

By default, InCopy protects you from typing characters that the current font does not support or from applying a font to a selection of text when that font does not contain one or more of the glyphs selected. However, you can turn off preference settings to remove this protection.

- 1 Choose Edit > Preferences > Advanced Type (Windows) or InCopy > Preferences > Advanced Type (macOS).
- 2 Do any of the following and then click OK.

Protect While Typing Select this option so that you cannot type glyphs that the current font does not support.

Protect When Applying Fonts Select this option to avoid introducing unsupported glyphs when a different font, such as a Roman font, is applied to Asian-language text.

Work with missing fonts

When you open or place documents that include fonts not installed on your system, an alert message appears, indicating which fonts are missing. If you select text that uses a missing font, the Character panel or Control panel indicates that this font is missing by displaying it in brackets in the font style pop-up menu.

Typography

InCopy substitutes missing fonts with an available font. When this happens, you can select the text and apply any other available font. Missing fonts for which others have been substituted will appear at the top of the Type > Font menu in a section marked “Missing Fonts.” By default, text formatted with missing fonts appears in pink highlighting.

If a TrueType font is installed and the document contains a Type 1 (T1) version of the same font, the font is displayed as missing.

You can choose Type > Find Font to find and change missing fonts. If a missing font is part of a style, you can update the font in that style by changing its style definition.

Make missing fonts available

Do any of the following:

- Install the missing fonts on your system.
- Place the missing fonts in the Fonts folder, which is located in the InCopy application folder. Fonts in this folder are available only to InCopy .
- Activate the missing fonts using a font-management application.

 *If you don't have access to the missing fonts, use the Find Font command to search for and replace missing fonts.*

Highlight substituted fonts in your document

If the Select Substituted Fonts preferences option is selected, text formatted with missing fonts appears in pink highlighting so that you can easily identify text formatted with a missing font.

- 1 Choose Edit > Preferences > Composition (Windows®) or InCopy > Preferences > Composition (macOS®).
- 2 Select Substituted Fonts, and then click OK.

Document installed fonts

Fonts in a Document Fonts folder that is in the same location as an InCopy document are temporarily installed when the document is opened. The Package command can generate a Document Fonts folder when you want to share your document or move it to a different computer.

Fonts in the Document Fonts folder are not the same as fonts available from the standard operating system font locations. They are installed when the document is opened and supersede any font of the same PostScript name. However, they supersede only fonts within the document. Fonts installed by one document are not available to other documents. When you close the document, the fonts that were installed for the document are uninstalled. Document installed fonts are listed in a submenu of the Font menu.

Some Type1 fonts are not available in the document. In addition, macOS fonts are not available when running InDesign in Windows.

Typography

Some multiple master fonts include an optical size axis, which lets you use a font specifically designed for optimal readability at a particular size. Generally, the optical size for a smaller font, such as 10 point, is designed with heavier serifs and stems, wider characters, less contrast between thick and thin lines, taller x height, and looser spacing between letters than the optical size for a larger font, such as 72 point.

- 1 Choose Edit > Preferences > Type (Windows) or InCopy > Preferences > Type (macOS).
- 2 Select Automatically Use Correct Optical Size, and click OK.

Text composition

Compose text

The appearance of text on your page depends on a complex interaction of processes called *composition*. Using the word spacing, letterspacing, glyph scaling, and hyphenation options you've selected, InCopy composes your type in a way that best supports the specified parameters.

InCopy offers two composition methods: Adobe Paragraph Composer (the default) and Adobe Single-line Composer (both are available from the Control panel menu). You can select which composer to use from the Paragraph panel menu, the Justification dialog box, or the Control panel menu.

InCopy supports four methods developed for typesetting, including Adobe Japanese Single-line Composer, Adobe Japanese Paragraph Composer, Adobe Paragraph Composer, and Adobe Single-line Composer. Each Composer evaluates possible breaks for Japanese and Roman text, and chooses those which best support the hyphenation and justification options specified for a given paragraph. The Adobe Japanese Paragraph Composer is selected by the default. For details on these options, see InCopy Help.

Composition methods

InCopy offers two composition methods: Adobe Paragraph Composer (the default) and Adobe Single-line Composer. Both composition methods evaluate possible breaks, and choose those that best support the hyphenation and justification options you've specified for a given paragraph.

The Adobe Paragraph Composer

Considers a network of breakpoints for an entire paragraph, and thus can optimize earlier lines in the paragraph in order to eliminate especially unattractive breaks later on. Paragraph composition results in more even spacing with fewer hyphens.

The Paragraph Composer approaches composition by identifying possible breakpoints, evaluating them, and assigning a weighted penalty to them based on such principles as evenness of letterspacing, word spacing, and hyphenation.

Typography

You can use the Hyphenation dialog box to determine the relationship between better spacing and fewer hyphens.

The Adobe Single-line Composer

Offers a traditional approach to composing text one line at a time. This option is useful if you want to restrict composition changes from late-stage edits.

Choose a composition method for a paragraph

Do any of the following:

- From the Paragraph panel menu, choose Adobe Paragraph Composer (the default) or Adobe Single-line Composer.
- From the Paragraph panel menu or the Control panel menu, choose Justification, and then choose an option from the Composer menu.

Note: Additional composition engine plug-ins from other companies may be available, along with interfaces that let you customize an engine's parameters.

Set composition preferences

- 1 Choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).
- 2 To use on-screen highlighting to identify compositional problems, select Keep Violations And H&J Violations (hyphenation and justification).
- 3 To justify text that wraps around an object, select Justify Text Next To An Object.
- 4 Under Mojikumi Compatibility Modes, determine whether you want to select Use New Vertical Scaling or Use CID-Based Mojikumi.
- 5 Click OK.

Hyphenate text

The settings you choose for hyphenation and justification affect the horizontal spacing of lines and the aesthetic appeal of type on your pages. Hyphenation options determine whether words can be hyphenated and, if they can, which breaks are allowable.

Justification is controlled by the alignment option you choose, the word spacing and letterspacing you specify, and whether or not you have used glyph scaling. You can also justify single words in narrow columns of fully justified text.

Adjust hyphenation manually

You can hyphenate words manually or automatically, or you can use a combination of the two methods. The safest way to hyphenate manually is to insert a *discretionary hyphen*, which is not visible unless the word needs to be broken at the end of a line. Placing a discretionary hyphen at the beginning of a word prevents it from being broken.

- 1 Using the Type tool , click where you want to insert the hyphen.
- 2 Do one of the following:
 - Choose Type > Insert Special Character > Hyphens And Dashes > Discretionary Hyphen.
 - Press Ctrl+Shift+- (Windows) or Command+Shift+- (macOS) to insert a discretionary hyphen.

Note: Entering a discretionary hyphen in a word does not guarantee that the word will be hyphenated. Whether or not the word breaks depends on other hyphenation and composition settings. However, entering a discretionary hyphen in a word does guarantee that the word can be broken only where the discretionary hyphen appears.

Adjust hyphenation automatically

Hyphenation is based on word lists that can be stored either in a separate user dictionary file on your computer, or in the document itself. To ensure consistent hyphenation, you may want to specify which word list to refer to, especially if you will be taking your document to a service provider or if you work in a workgroup.

To turn automatic hyphenation on or off for a paragraph, in the Paragraph panel or Control panel, select or deselect the Hyphenation option. (You can also include this option in a paragraph style.)

When you set automatic hyphenation options, you can determine the relationship between better spacing and fewer hyphens. You can also prevent capitalized words and the last word in a paragraph from being hyphenated.

Set automatic hyphenation options for a paragraph

- 1 Click in a paragraph or select the range of paragraphs you want to affect.
- 2 Choose Hyphenation from the Paragraph panel menu.
- 3 Select the Hyphenate option.
- 4 Make changes to the following settings as needed, and then click OK:

Words With At Least _ Letters Specify the minimum number of characters for hyphenated words.

After First _ Letters / Before Last _ Letters Specify the minimum number of characters at the beginning or end of a word that can be broken by a hyphen. For example, by specifying 3 for these values, *aromatic* would be hyphenated as *aro- matic* instead of *ar- omatic* or *aromat- ic*.

Hyphen Limit _ Hyphens Specify the maximum number of hyphens that can appear on consecutive lines. Zero means unlimited hyphens.

Hyphenation Zone Specify the amount of white space allowed at the end of a line of unjustified text before hyphenation begins. This option applies only when you're using the Single-line Composer with nonjustified text.

Better Spacing / Fewer Hyphens To alter the balance between these settings, adjust the slider at the bottom of the dialog box.

Hyphenate Capitalized Words To prevent capitalized words from being hyphenated, deselect this option.

Hyphenate Last Word To prevent last words in paragraphs from being hyphenated, deselect this option.

Hyphenate Across Column To prevent words from being hyphenated across a column, frame, or page, deselect this option.

Prevent unwanted word breaks

By using nonbreaking hyphens, you can prevent certain words from breaking at all—for example, proper names or words which, when broken, become unattractive fragments. By using nonbreaking spaces, you can also keep multiple words from breaking—for example, clusters of initials and a last name (P. T. Barnum).

Prevent text from breaking

- 1 Select the text you want to keep on the same line.
- 2 Choose No Break from the Character panel menu or the Control panel menu.

 Another way to prevent a word from breaking is to place a discretionary hyphen at the beginning of the word. Press **Ctrl+Shift+-** (Windows) or **Command+Shift+-** (macOS) to insert a discretionary hyphen.

Create a nonbreaking hyphen

- 1 Using the Type tool , click where you want to insert the hyphen.
- 2 Choose **Type > Insert Special Character > Hyphens And Dashes > Nonbreaking Hyphen**.

Create a nonbreaking space

- 1 Using the Type tool , click where you want to insert the space.
- 2 Choose **Type > Insert White Space > Nonbreaking Space** (or any other white space character).

The Nonbreaking Space varies in width depending on point size, the justification setting, and word space settings, whereas the Nonbreaking Space (Fixed Width) character maintains the same width regardless of context.

Change Justification settings

Use the Justification panel to precisely control how word spacing, letterspacing, and glyph scaling. Adjusting spacing is especially useful with justified type, although you can also adjust spacing for unjustified type.

 *Word spacing, character spacing, and glyph scalings for justification settings, are ignored for CJK text. To set CJK text character spacing, use the Mojikumi dialog box.*

Adjust word and letterspacing in justified text

- 1 Insert the cursor in the paragraph you want to change, or select a type object or frame to change all of its paragraphs.
- 2 Choose **Justification** from the Paragraph panel menu.
- 3 Enter values for **Word Spacing**, **Letter Spacing**, and **Glyph Spacing**. The **Minimum** and **Maximum** values define a range of acceptable spacing for justified paragraphs only. The **Desired** value defines the desired spacing for both justified and unjustified paragraphs:

Word Spacing The space between words that results from pressing the spacebar. Word Spacing values can range from 0% to 1000%; at 100%, no additional space is added between words.

Letter Spacing The distance between letters, including kerning or tracking values. Letter Spacing values can range from -100% to 500%: at 0%, no space is added between letters; at 100%, an entire space width is added between letters.

Glyph Scaling The width of characters (a glyph is any font character). Glyph Scaling values can range from 50% to 200%.

 *Spacing options are always applied to an entire paragraph. To adjust the spacing in a few characters, but not an entire paragraph, use the Tracking option.*

- 4 Set the **Single Word Justification** option to specify how you want to justify single-word paragraphs.

In narrow columns, a single word can occasionally appear by itself on a line. If the paragraph is set to full justification, a single word on a line may appear to be too stretched out. Instead of leaving such words fully justified, you can center them or align them to the left or right margins.

Set glyph scaling in justified text

- 1 Click an insertion point in a paragraph or select the paragraphs you want to affect.
- 2 Choose **Justification** from the Paragraph panel menu.

Typography

- 3 Type values for Glyph Scaling Minimum, Desired, and Maximum. Then click OK.

 *Glyph scaling can help in achieving even justification; however, values more than 3% from the 100% default value may result in distorted letter shapes. Unless you're striving for a special effect, it's best to keep glyph scaling to subtle values, such as 97–100–103.*

Use a flush space with justified text

Using a flush space character adds a variable amount of space to the last line of a fully justified paragraph—between the last word and an end-of-story character from a decorative font. Used with nonjustified text, the flush space appears as a normal word space. In justified text, it expands to absorb all available extra space on the last line. Using a flush space can make a dramatic difference in the way the entire paragraph is formatted by the Adobe Paragraph Composer.

- 1 Using the Type tool , click directly in front of the end-of-story character.
- 2 Choose Type > Insert White Space > Flush Space.

Note: The effect of a flush space isn't apparent until you apply the Justify All Lines option to the paragraph.

Highlight lines that are too loose or tight

Because composing a line of type involves factors in addition to word spacing and letterspacing (hyphenation preferences, for example), InDesign cannot always honor your settings for word spacing and letterspacing. However, compositional problems in lines of text can be highlighted in yellow; the darkest of three shades indicates the most serious problems.

- 1 Choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).
- 2 Select H&J Violations and click OK.

Tabs and indents

Tabs dialog box overview

Tabs position text at specific horizontal locations in a frame. The default tab settings depend on the Horizontal ruler units setting in the Units & Increments preferences dialog box.

Tabs apply to an entire paragraph. The first tab you set deletes all default tab stops to its left. Subsequent tabs delete all default tabs between the tabs you set. You can set left, center, right, and decimal or special-character tabs.

You set tabs using the Tabs dialog box.

A Tab alignment buttons B Tab position C Tab Leader box D Align On box E Tab ruler F Snap above frame

When you do this in a vertical text frame, the Tabs dialog box also becomes vertical. When the Tabs dialog box direction is not consistent with the text frame direction, click on the magnet icon  to snap the rulers to the current text frame.

Open the Tabs dialog box

- 1 Using the Type tool, click in the text frame.
- 2 Choose Type > Tabs.

If the top of the frame is visible, the Tabs dialog box snaps to the current text frame and matches its width to the current column.

Typography

When the top of a horizontal frame is displayed, the Tabs dialog box will snap to the top of the current text frame, and the width will change to conform to the width of the current column. When there is a text insertion point in a vertical frame, the Tabs dialog box will snap to the right side of the text frame, and the length displayed will conform to the length of the current column.

Align the Tabs dialog box ruler with your text

- 1 In Layout View, scroll through your document to display the top of the content.
- 2 Scroll through your document to display the top of the text frame.
- 3 Click the magnet icon  on the Tabs dialog box. The Tabs dialog box snaps to the top of the column that includes the selection or the insertion point.

Set tabs

You can set left, center, right, and decimal or special-character tabs. When you use the special-character tab, you can set a tab to align to any character you choose, such as a colon or a dollar sign.

- 1 To see the effect of changing tab settings, choose View > Layout View.
- 2 Using the Type tool , click an insertion point in the paragraph.
- 3 Press the Tab key. Add tabs in the paragraphs where you want to add horizontal space. (You can also add tabs after you create your tab settings.)

- 4 Choose Type > Tabs to display the Tabs dialog box.
- 5 To specify which paragraphs will be affected, select a paragraph or a group of paragraphs.

Note: In Galley view and Story view, adding a tab at the beginning of the paragraph indents the text the same amount, regardless of the tab position. Layout view shows the actual distance of the tab.

- 6 For the first tab, click a tab-alignment button (left, right, center, or decimal) in the Tabs dialog box to specify how text will align to the tab's position.
- 7 Do one of the following:
 - Click a location on the tab ruler to position a new tab.

Typography

- Type a position in the X box and press Enter or Return. If the X value is selected, press the up or down arrow key to increase or decrease the tab value by 1 point, respectively.

8 For subsequent tabs with different alignments, repeat steps 3 and 4.

 To insert a tab character in a table, choose *Type > Insert Special Character > Other > Tab*.

Repeat tabs

The Repeat Tab command creates multiple tabs based on the distance between the tab and the left indent or the previous tab stop.

- 1 Click an insertion point in the paragraph.
- 2 In the Tabs panel, select a tab stop on the ruler.
- 3 Choose Repeat Tab from the panel menu.

A Tab-alignment buttons B Tab stop on the ruler C Panel menu

Move, delete, and edit tab settings

Use the Tabs dialog box to move, delete, and edit tab settings.

Move a tab setting

- 1 Using the Type tool , click an insertion point in the paragraph.
- 2 In the Tabs dialog box, select a tab on the tab ruler.
- 3 Do one of the following:
 - Type a new location for X and press Enter or Return.
 - Drag the tab to a new location.

Delete a tab setting

- 1 Click an insertion point in the paragraph.
- 2 Do one of the following:
 - Drag the tab off the tab ruler.
 - Select the tab, and choose Delete Tab from the panel menu.
 - To return to the default tab stops, choose Clear All from the panel menu.

Change a tab from one alignment to another

- 1 In the Tabs dialog box, select a tab on the tab ruler.
- 2 Click a tab-alignment button.

 You can also hold down **Alt** / **Option** while clicking the tab setting to cycle through the four alignment options.

Specify characters for decimal tabs

You use decimal tabs to align text with a character you specify, such as a period or a dollar sign.

- 1 In the Tabs panel, create or select a decimal tab  on the tab ruler.
- 2 In the Align On box, type the character to which you want to align. You can type or paste any character. Make sure that the paragraphs you're aligning contain that character.

Add tab leaders

A *tab leader* is a repeated pattern of characters, such as a series of dots or dashes, between a tab and the following text.

- 1 In the Tabs panel, select a tab stop on the ruler.
- 2 Type a pattern of as many as eight characters in the Leader box, and then press **Enter** or **Return**. The characters you entered repeat across the width of the tab.
- 3 To change the font or other formatting of the tab leader, select the tab character in the text frame, and use the Character panel or Type menu to apply formatting.

Insert right indent tabs

In one step, you can add a right-aligned tab at the right indent, making it easier to prepare tabular text that spans an entire column. Right indent tabs are slightly different from regular tabs. A right indent tab:

- Aligns all subsequent text to the right edge of the text frame. If the same paragraph includes any tabs after the right indent tab, those tabs and their text are pushed to the next line.

Typography

- Is a special character located in the text, not in the Tabs dialog box. You add a right indent tab using a context menu, not the Tabs dialog box. As a result, a right indent tab can't be part of a paragraph style.
- Is different from the Right Indent value in the Paragraph panel. The Right Indent value keeps the entire right edge of the paragraph away from the right edge of the text frame.
- Can be used with a tab leader. Right indent tabs use the tab leader of the first tab stop past the right margin, or, if there isn't one, the last tab stop before the right margin.

- 1 Using the Type tool **T**, click on the line where you want to add the right indent tab.
- 2 Choose Type > Insert Special Character > Other > Right Indent Tab.

Set indents

Indents move text inward from the right and left edges of the frame. In general, use first-line indents, not spaces or tabs, to indent the first line of a paragraph.

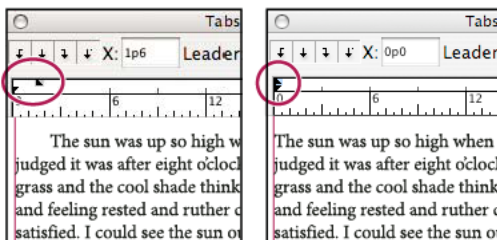

A first-line indent is positioned relative to the left-margin indent. For example, if a paragraph's left edge is indented one pica, setting the first-line indent to one pica indents the first line of the paragraph two picas from the left edge of the frame or inset.

You can set indents using the Tabs dialog box, the Paragraph panel, or the Control panel. You can also set indents when you create bulleted or numbered lists.

When setting CJK characters, you can use the mojikumi setting to specify the indent for the first line. However, for text in which the first line indent was specified in the Paragraph panel, if you specify indents in mojikumi settings, you can make the text indent the sum value of both indents.

Set an indent using the Tabs dialog box

- 1 Using the Type tool **T**, click in the paragraph you want to indent.
- 2 Choose Type > Tabs to display the Tabs dialog box.
- 3 Do one of the following to the indent markers  in the Tabs dialog box:
 - Drag the top marker to indent the first line of text. Drag the bottom marker to move both markers and indent the entire paragraph.

- Select the top marker and type a value for X to indent the first line of text. Select the bottom marker and type a value for X to move both markers and indent the entire paragraph.

Set indents using the Paragraph panel or the Control panel

- 1 Using the Type tool **T**, click in the paragraph you want to indent.

Typography

- 2 Adjust the appropriate indent values in the Paragraph panel or Control panel. For example, do the following:
 - To indent the entire paragraph one pica, type a value (such as **1p**) in the Left Indent box .
 - To indent only the first line of a paragraph one pica, type a value (such as **1p**) in the First Line Left Indent box .
 - To create a hanging indent of one pica, type a positive value (such as **1p**) in the Left Indent box and type a negative value (such as **-1p**) in the First Line Left Indent box. See [Set indents](#).

Reset indents

- 1 Click in the paragraph in which you want to reset indents to the zero mark.
- 2 Choose Reset Indents from the Tabs dialog box menu.

Create a hanging indent

In a hanging indent, all the lines in a paragraph are indented except for the first line. Hanging indents are especially useful when you want to add inline graphics at the beginning of the paragraph.

- 1 Using the Type tool , click in the paragraph you want to indent.
- 2 In the Tabs dialog box or the Control panel, specify a left indent value greater than zero.
- 3 To specify a negative first-line left indent value, do one of the following:
 - In the Control panel, type a negative value for the first-line left indent .
 - In the Tabs dialog box, drag the top marker to the left, or select the marker and type a negative value for X.

In most cases, you'll specify the negative equivalent of the value you entered in step 2; for instance, if you specified a left indent of 2 picas, your first-line left indent will typically be -2 picas.

Right-indent the last line of a paragraph

You can use the Last Line Right Indent option to add a hanging indent on the right side of the last line in a paragraph. This option is especially useful for right-aligning prices in a sales catalog.

Typography

- 1 Type your paragraphs. In the last line of each paragraph, place the insertion point before the text to be indented, and choose Type > Insert Special Character > Other > Right Indent Tab.
- 2 Select the paragraphs.
- 3 To create a right indent for paragraphs, specify a value (such as **2p**) in the Right Indent field of the Paragraph panel or Control panel.
- 4 To offset the right indent value for the text that follows the tab, type a negative value (such as **-2p**) in the Last Line Right Indent field of the Paragraph panel or Control panel.

Use Indent To Here

You can use the Indent To Here special character to indent lines in a paragraph independently of a paragraph's left indent value. The Indent To Here special character is different from the paragraph's left indent in the following ways:

- Indent To Here is part of the text flow, as if it were a visible character. If text reflows, the indent moves with it.
- Indent To Here affects all lines after the line where you've added its special characters, so you can indent just some of the lines in a paragraph.
- When you choose Type > Show Hidden Characters, the Indent To Here character ¶ is visible.

- 1 Using the Type tool ¶, click the insertion point where you would like to indent.
- 2 Choose Type > Insert Special Character > Other > Indent To Here.

Leading

About leading

This topic refers to how leading is implemented in Roman composition.

The vertical space between lines of type is called *leading*. Leading is measured from the baseline of one line of text to the baseline of the line above it. *Baseline* is the invisible line on which most letters—that is, those without descenders—sit.

The default auto-leading option sets the leading at 120% of the type size (for example, 12-point leading for 10-point type). When auto-leading is in use, InCopy displays the leading value in parentheses in the Leading menu of the Character panel.

A Leading B Text height C Larger text size of one word increases leading for that one line.

About leading in Asian text

The basis position for leading can be set through the Leading Basis Position setting in the Paragraph panel menu. With the default setting (Embox Top/Right), the text line leading is measured from the top of its embox to the top of the next line's embox. By selecting the line and increasing the leading value using the Embox top/Right setting, the space between the selected line and the next line will grow, because the direction leading is measured from the current line to the next line. All other Leading Basis Position settings measure leading from the current line to the previous line, so changing the leading amount with those settings will increase the line aki above the current line.

Set leading from Leading in the Character panel or Control panel. This is set to Automatic by default. When Auto Leading is set, the leading value is displayed in parentheses in Leading in the Character panel. This Automatic value varies for text frames and text in frame grids. The Automatic Leading value can be set from the Justification menu item in the Paragraph panel. The default setting for the automatic leading value for text in text frames in InCopy is 175% of the set font size. For text in frame grids, it is 100%, which allows for the grid alignment to spread out the lines of the text in the grid.

Typography

When grid alignment is set to None, set text leading in the text frame with the Leading value in the Character panel. When grid alignment is set to anything other than None, leading will be applied according to the baseline grid settings.

Note: When copying text placed on the frame grid and pasting into a text frame, the text is pasted with the frame grid attributes intact, so Automatic in Leading is set to 100%. If line spacing appears squeezed, set a value for Leading instead of using the automatic setting.

To set Leading for text in frame grids use Line Gap in the Frame Grid Settings dialog box instead of the leading value. The leading value for text in the frame grid is the sum of the Line Gap value and the grid size (font size). In other words, if the grid size is 13Q and line gap is 10H, the actual leading value will be "23H".

Please note that for text placed in the frame grid, the default grid justification is set to Center. In this case, the value between the grid center and the center of the next grid will be the leading value. When grid justification has been set to None, leading will be applied from the location specified in the grid. When grid justification is set to None, leading will be applied according to the value set in Leading in the Character panel.

Leading within a frame grid is complex. For placed text, the actual leading value changes depending on the Font Size, Leading value and also the Gyoudori settings in the Paragraph panel. Take note of the following:

- If you leave the font size for the frame grid unchanged, but make the font size or leading value of placed text smaller than the grid size in the Character panel, the text will be aligned to the grid according to the Grid Justification settings.
- If you leave the font size (grid size) for a frame grid unchanged but use the Character panel to make the font size of placed text larger than the grid size+line gap, gyoudori will be determined automatically, and you can align to the grid in increments of 0.5 lines, therefore 1.5, 2, 2.5 and 3 and so on if Gyoudori is set to Automatic. If Gyoudori is set to anything other than Automatic, text will be aligned to the grid according to this setting, and for a large font size the characters will overlap.
- If you leave the font size (grid size) of the frame grid unchanged but use the Character panel to set the gyoudori of placed text to a value larger than the grid size+line gap, leading will apply to the next line when leading is set to Automatic. For example, if the frame grid size is 13Q and the line gap is set to 10H, when leading is set to 24H, text will be placed on every other line. If set to 47H, text will be placed on every third line. For any leading setting other than Automatic, the value set in Leading will be ignored.

Change leading

By default, leading is a character attribute, which means that you can apply more than one leading value within the same paragraph. The largest leading value in a line of type determines the leading for that line. However, you can select a preferences option so that leading applies to the entire paragraph, instead of to text within a paragraph. This setting does not affect the leading in existing frames.

Change leading of selected text

- 1 Select the text you want to change.
- 2 Do any of the following:
 - In the Character panel or Control panel, choose the leading you want from the Leading menu .
 - In the Character panel or Control panel, choose the leading you want from the Leading menu .
 - Select the existing leading value and type a new value.
 - While creating a paragraph style, change the leading using the Basic Character Formats panel.

If InCopy ignores the leading change, it may be due to Vertical Justification or Align To Baseline Grid being selected. Choose Object > Text Frame Options and make sure Vertical Justification is set to Top, and make sure Do Not Align To Baseline Grid is selected in the Paragraph panel, Control panel, or paragraph style.

You can also adjust vertical space by aligning text to the baseline grid. When baseline grid is set, the baseline grid setting takes precedence over the leading value.

Change the default leading percentage

- 1 Select the paragraphs that you want to change.
- 2 Choose Justification from the Paragraph panel menu or from the Control panel menu.
- 3 Choose Roman Justification from the Paragraph panel menu.
- 4 For Auto Leading, specify a new default percentage. The minimum value is 0%, and the maximum value is 500%.

Note: The Auto option in the Leading pop-up menu of the Control panel menu sets Auto Leading value in the Justification dialog box as a ratio (%) of character size. The default is 175% for text frames and 100% for frame grids.

Apply leading to whole paragraphs

- 1 Choose Edit > Preferences > Type (Windows) or InCopy > Preferences > Type (macOS).
- 2 Select Apply Leading To Entire Paragraph, and then click OK.

Note: When you use a character style to apply leading to text, the leading affects only the text to which the style is applied, not the entire paragraph, regardless of whether the Apply Leading To Entire Paragraph option is selected.

Adjust line height based on character proportion

By changing the text orientation in a frame grid to its opposite (for horizontal text, it is vertical; for vertical text, it is horizontal), the line height will be changed by default regardless of the grid size. For example, for 13Q characters placed in a horizontal type 13Q frame grid, when setting the character's vertical proportion to 200%, regardless of grid size, the line height will be doubled and become 26Q. If this function is turned off, the line height will be the same as the character height and only the character proportion will be changed.

- 1 Select text for which you would like to change the line height based on character proportion.
- 2 From the Character panel menu or Control panel menu, select Adjust Line Height With Character Scale.

The line height is adjusted. As a character attribute, this feature is set for each character, but line height is applied to an entire line containing the set characters.

To disable this feature, select the text for which the feature was enabled, and reselect Adjust Line Height with Character Scale from the Character panel menu or Control panel menu, and turn it off.

Apply the leading basis position

If you set grid alignment to None, leading is applied from the top or right of the embox of the current line to the top or right of the embox of the next line by default. Increasing the leading value causes the new value to be applied to all selected lines.

- 1 Select the text and set Grid Alignment to None in the Paragraph panel menu or the Control panel menu.
- 2 Specify Leading in the Character panel. Specify a value other than Automatic and set to Static Value Leading.
- 3 Select the appropriate leading basis from Leading Basis Position in the Paragraph panel menu or the Control panel menu.

Typography

To set even leading regardless of font size, you can use Embox Center to set leading from the center of the line.

 For frame grids, to align to the grid line spacing for lines with different font sizes, set grid alignment to Center and set Gyoukori to anything other than Automatic in the Paragraph panel.

Leading Basis Position options

From Leading Basis Position in the Paragraph panel menu or Control panel menu, select from the following options for leading basis.

Embox Top/Right Leading will be based on the top of the embox for horizontal type or on the right of the embox for vertical type. Leading is measured from the top or right of the current line to the top or right of the next line. These settings are the default settings.

Embox Center Leading will be based from the center of the current line to the center of the previous line. If different font sizes exist within the same paragraph, the space between the embox edges of each line will be uneven. When Embox Center is selected, by setting fixed leading for text with differing font sizes, you can align line spacing for surrounding lines because leading will occur based on the center of the current embox.

Roman Baseline Leading occurs based on the Roman Baseline. Leading is measured from the baseline of the current line to the baseline of the previous line. This leading method is the same as that which is used in the Roman composer. The Roman Baseline is different for each font. The character position may vary even within the same font size if the fonts are different.

Embox Bottom/Left Leading occurs based from the bottom of the embox for horizontal type or from the left of the embox for vertical type. Leading is measured from the left or bottom of the current line to the left or bottom of the previous line.

Note: The same item is present in Grid Alignment in both the Paragraph panel menu and in the Control panel menu. These items are the bases for aligning to the grid, and not bases for leading. Do not confuse these.

Kerning and tracking

About kerning and tracking

Kerning is the process of adding or subtracting space between specific pairs of characters. Tracking is the process of loosening or tightening a block of text.

Note: Values for kerning and tracking affect Japanese text but normally these options are used to adjust the aki between roman characters.

Types of kerning

You can automatically kern type using metrics kerning or optical kerning. *Metrics kerning* uses kern pairs, which are included with most fonts. Kern pairs contain information about the spacing of specific pairs of letters. Some of these are: LA, P, To, Tr, Ta, Tu, Te, Ty, Wa, WA, We, Wo, Ya, and Yo.

Typography

InCopy uses metrics kerning by default so that specific pairs are automatically kerned when you import or type text. To disable metrics kerning, select "0".

Optical kerning adjusts the spacing between adjacent characters based on their shapes. Some fonts include robust kern-pair specifications. However, when a font includes only minimal built-in kerning or none at all, or if you use two different typefaces or sizes in one or more words on a line, you may want to use the *optical kerning* option.

Optical kerning adjusts the spacing between adjacent characters based on their shapes, and is optimized for use with Roman glyphs. Some fonts include robust kern-pair specifications. However, when a font includes only minimal built-in kerning or none at all, or if you use two different typefaces or sizes in one or more words on a line, you may want to use the *optical kerning* option for the Roman text in your document.

You can also use *manual kerning*, which is ideal for adjusting the space between two letters. Tracking and manual kerning are cumulative, so you can first adjust individual pairs of letters, and then tighten or loosen a block of text without affecting the relative kerning of the letter pairs.

Word kerning isn't the same as the Word Spacing option in the Justification dialog box; word kerning changes the kerning value only between a specific word's first character and the word space preceding that character.

A Original B Kerning applied between "W" and "a" C Tracking applied

How kerning and tracking are measured

You can apply kerning, tracking, or both to selected text. Tracking and kerning are both measured in 1/1000 em, a unit of measure that is relative to the current type size. In a 6-point font, 1 em equals 6 points; in a 10-point font, 1 em equals 10 points. Kerning and tracking are strictly proportional to the current type size.

Tracking and manual kerning are cumulative, so you can first adjust individual pairs of letters, and then tighten or loosen a block of text without affecting the relative kerning of the letter pairs.

When you click to place the insertion point between two letters, InCopy displays kerning values in the Character panel and the Control panel. Metrics and optical kerning values (or defined kern pairs) appear in parentheses. Similarly, if you select a word or a range of text, InCopy displays the tracking values in the Character panel and Control panel.

Apply kerning to text

You apply either of two types of automatic kerning: metrics kerning or optical kerning, or you can adjust the spacing between letters manually.

Use metrics kerning

- 1 Set the text insertion point between the characters you want to pair kern, or select text.
- 2 In the Character panel or Control panel, select Metrics in the Kerning  menu.
- 3 In the Character panel or Control panel, select Metrics or Metrics - Roman Only in the Kerning  menu.

Note: If Metrics is applied to fonts (including some Japanese OpenType fonts) which do not contain pair kerning information, spacing for each character will be set to “0” and character compression will not occur.

To avoid using the built-in kerning information of a font for selected text, choose “0” in the Kerning  menu.

Note: The default setting is Metrics – Roman Only. When Metrics - Roman Only is applied to Roman OpenType fonts, kerning is the same as when Metrics is selected. When Metrics - Roman Only is applied to CJK OpenType fonts, only the Roman characters will be kerned with kerning pairs as if Metrics were set. The CJK characters will not be kerned, as if '0' were set. For this reason, choose '0' to turn off pair kerning.

Note: If you use font metrics kerning in a Japanese OpenType font, it is recommended that you choose OpenType > Use Proportional Metrics from the Control panel menu. That way, you can avoid making unnecessary manual kerning adjustments.

Use optical kerning

- 1 Set the text insertion point between characters you want to pair kern or select the text you want to kern.
- 2 In the Character panel or Control panel, select Optical in the Kerning  menu.

Note: Optical Kerning is designed on the basis of Roman character forms. You can use this feature with CJK fonts, but you should always check the results of the operation.

Adjust kerning manually

- 1 Using the Type tool , click to place an insertion point between two characters.

Note: If a range of text is selected, you can't manually kern the text (you can choose only Metrics, Optical, or 0). Instead, use tracking.

Note: If a range of text is selected, you can't manually kern the text (you can choose only Metrics, Metrics - Roman Only, Optical, or 0). Instead, use tracking.

- 2 Do any of the following:
 - In the Character panel or the Control panel, type or select a numeric value in the Kerning menu.
 - Press Alt+Left/Right Arrow (Windows) or Option+Left/Right Arrow (macOS) to decrease or increase the kerning between two characters.

The amount of the word kerning adjustment is the same as the Kerning value in the Units & Increments Preferences dialog box. When you press the shortcut and hold down the Ctrl or Command key, the kerning amount is the Kerning preferences value multiplied by 5.

Change the default kerning increment value

In the Units & Increments section of the Preferences dialog box, type a new value for the Kerning option and click OK.

Turn off kerning for selected text

- 1 Select text.
- 2 In the Character panel or Control panel, type or choose 0 in the Kerning menu.

You can also press Alt+Ctrl+Q (Windows) or Option+Command+Q (macOS) to reset kerning and tracking. When you do so, kerning is set to Metrics regardless of which kerning option was previously applied.

Adjust tracking

- 1 Select a range of characters.
- 2 In the Character panel or Control panel, type or select a numeric value for Tracking .

Highlight text containing custom kerning and tracking

In some instances, you'll want to be aware of text that has custom tracking and kerning applied. If you select the Custom Tracking/Kerning preferences option, green highlighting appears over text with custom tracking or kerning.

- 1 Choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).
- 2 Select Custom Tracking/Kerning, and then click OK.

Adjust kerning between words

With the Type tool , select a range of text and do one of the following:

- To add space between selected words, press Alt+Ctrl+\ (Windows) or Option+Command+\ (macOS).
- To remove space between selected words, press Alt+Ctrl+Backspace (Windows) or Option+Command+Delete (macOS).
- To multiply the kerning adjustment by 5, hold down Shift as you press the keyboard shortcut.

Aligning text

Align or justify text

Text can be aligned with one or both edges (or *insets*) of a text frame. Text is said to be *justified* when it is aligned with both edges. You can choose to justify all text in a paragraph excluding the last line (Justify Left or Justify Right), or you can justify text in a paragraph including the last line (Justify All). When you have only a few characters on the last line, you may want to use a special end-of-story character and create a flush space.

Typography

Note: When you justify all lines of text and you are using the Adobe Paragraph Composer, InDesign shifts text to ensure that the paragraph has consistent text density and is visually appealing. You can fine-tune spacing in justified text.

When you set center or justify for text in a frame grid, the text will no longer align exactly with the grid. You can also specify paragraph alignment for all the paragraphs in the frame grid.

- 1 Select text.
- 2 Click one of the Alignment buttons (Align Left, Align Center, Align Right, Left Justify, Center Justify, Right Justify and Full Justify) in the Paragraph panel or Control panel.
- 3 (Optional) Click Align Towards Spine or Align Away From Spine.

When you apply Align Towards Spine to a paragraph, text on a left-hand page is right-aligned, but when the same text flows onto (or if the frame is moved to) a right-hand page, it becomes left aligned. Similarly, when you apply Align Away From Spine to a paragraph, text on a left-hand page is left aligned, while text on a right-hand page is right aligned.

In vertical frames, aligning to or away from the spine has no effect, since text alignment is parallel to the spine direction.

 If you want the left side of a line of text to be left-aligned and the right side to be right-aligned, position the insertion point where you want to right-align the text, press Tab, and then right-align the rest of the line.

Align paragraphs to a baseline grid

When formatting paragraphs in a plain text frame, you might find it particularly useful to align paragraphs to the baseline grid. By default, text in a frame grid is aligned to the embox center, but you can also change individual paragraph grid alignment to align to the roman baseline, the frame grid embox, or the frame grid ICF.

The baseline grid represents the leading for body text in a document. You can use multiples of this leading value for all elements of the page to ensure that text always lines up between columns and from page to page. For example, if the body text in your document has 12-point leading, you could give your heading text 18-point leading and add 6 points of space before the paragraphs that follow the headings.

A Text aligned to the embox center B Text aligned to the embox top C Text aligned to the ICF

Typography

Apart from specifying grid alignment, you can also specify whether or not to align only the first line of a paragraph to the grid. Furthermore, when characters of different sizes are in the same line, you can specify how to align the small characters to the larger ones.

Note: When the text is the same size as the default frame grid settings, the text position won't change even if you change the grid alignment. When you use a font or size different to the default frame settings for text in a frame grid, changing the grid alignment has an effect.

Change settings for the baseline grid by using the Grids section of the Preferences dialog box.

To view the baseline grid, choose View > Grids & Guides > Show Baseline Grid. The baseline grids appear in the same direction as the writing direction of the text frame.

Note: The baseline grid is visible only if the document zoom level is greater than the view threshold setting in Grids Preferences. You may need to zoom in to view the baseline grid.

Align paragraphs to the baseline grid

- 1 Select text.
- 2 Choose Grid Alignment > Roman Baseline from the Paragraph panel menu.

Align only the first line to the baseline grid

- 1 Select the paragraphs you want to align.
- 2 Choose Only Align First Line to Grid from the Paragraph menu or Control panel menu.
- 3 In the Paragraph panel or Control panel, click Align to Baseline Grid .
- 4 Choose an option other than None from Grid Alignment in the Paragraph panel or Control panel menu.

When the leading is set to a value greater than the baseline grid, automatic gyoukori occurs, snapping the line to the next line in the grid. For example, when the leading is 16-point and the baseline grid is 14-point, the text will snap to the grid line every second line.

To align text in the center of a baseline grid, above or below virtual body, or above or bottom of average printing surface, select an option other than None from the Grid Alignment menu.

Align paragraphs to a baseline grid

The baseline grid represents the leading for body text in a document. You can use multiples of this leading value for all elements of the page to ensure that text always lines up between columns and from page to page. For example, if the body text in your document has 12-point leading, you could give your heading text 18-point leading and add 6 points of space before the paragraphs that follow the headings.

Using a baseline grid ensures consistency in the location of text elements on a page. You can adjust the leading for the paragraph to ensure that its baselines align to the page's underlying grid. This is useful if you want the baselines of text in multiple columns or adjacent text frames to align. Change settings for the baseline grid by using the Grids section of the Preferences dialog box.

You can also align only the first line of a paragraph to the baseline grid, allowing the rest of the lines to follow the specified leading values.

To view the baseline grid, choose View > Grids & Guides > Show Baseline Grid.

Note: The baseline grid is visible only if the document zoom level is greater than the view threshold setting in Grids Preferences. You may need to zoom in to view the baseline grid.

Align paragraphs to the baseline grid

- 1 Select text.
- 2 In the Paragraph panel or Control panel, click Align To Baseline Grid .

To ensure that the leading of your text does not change, set the baseline grid leading to the same leading value as your text, or to a factor thereof.

Align only the first line to the baseline grid

- 1 Select the paragraphs you want to align.
- 2 Choose Only Align First Line To Grid from the Paragraph menu or Control panel menu.
- 3 In the Paragraph panel or Control panel, click Align To Baseline Grid .

Create balanced headline text

You can balance ragged aligned text across multiple lines. This feature is especially useful for multiline headings, pull-quotes, and centered paragraphs.

- 1 Click in the paragraph you want to balance.
- 2 In the Paragraph panel or Control panel, choose Balance Ragged Lines from the menu.

This feature takes effect only when the Adobe Paragraph Composer is selected.

This function is only available when Alignment is set to Align Left/Top, Center Justify or Align Right/Bottom and when Adobe Paragraph Composer has been used.

Set Gyoudori

Gyoudori aligns a specified number of lines in the center of a paragraph. You can use gyoudori to highlight single line paragraphs, such as headings or titles. If the paragraph has more than one line, you can choose Paragraph Gyoudori so that the entire paragraph spans the number of lines.

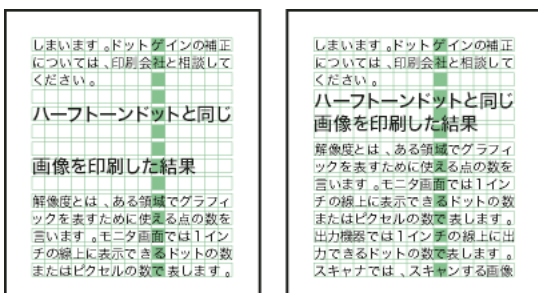

- 1 From Gyoukori  in the Paragraph panel or Control panel, specify the number of lines you want to center justify.
- 2 To center the entire paragraph across the specified number of lines, choose Paragraph Gyoukori from the Paragraph panel menu or Control panel menu.

Note: Gyoukori is set to the baseline grid value as standard in text frames.

Set paragraph gyoukori

When you apply gyoukori to a paragraph of more than one line, choosing Paragraph Gyoukori allows the entire paragraph to span the specified number of gyoukori lines, often 2 paragraph lines on 3 grid lines. If this option is not selected, each line in the paragraph spans the specified number of gyoukori lines, such as 2 paragraph lines on 6 grid lines.

- 1 Select the paragraph to which you want to apply paragraph gyoukori.
- 2 Choose Paragraph Gyoukori from the Paragraph panel menu or the Control panel menu.
- 3 Adjust the leading of the gyoukori paragraph to suit your layout needs.

When Paragraph Gyoukori is used to center the paragraph on a number of grid lines, the line spacing of each line is governed by the leading amount, not by the grid aki. It may be necessary to adjust the leading of each line to space them out if the default 100% auto leading amount for frame grid text is used.

Create paragraphs that span or split columns

You can make a paragraph span across multiple columns in a text frame to create a straddle head effect. You can choose whether a paragraph spans all columns or a specified number of columns. When a paragraph is set to span across columns in a multicolumn text frame, any text before the spanning paragraph becomes balanced as a result.

You can also split a paragraph into multiple columns within the same text frame.

Typography

A A heading that spans columns **B** Split column

Span a paragraph across columns

- 1 Place the insertion point inside the paragraph.

You can also make this feature part of a paragraph style, such as a heading style.

- 2 Choose Span Columns from the Control panel menu or a Paragraph panel menu.
- 3 Choose Span Columns from the Paragraph Layout menu.
- 4 Choose the number of columns you want the paragraph to span from the Span menu. Choose All if you want the paragraph to span across all the columns.
- 5 To add extra space before or after the span paragraph, specify Space Before Span and Space After Span values, and then click OK.

Split a paragraph into columns

- 1 Place the insertion point inside the paragraph.

You can also make this feature part of a paragraph style, such as a heading style.

- 2 Choose Span Columns from the Control panel menu or a Paragraph panel menu.
- 3 Choose Split Columns from the Paragraph Layout menu.
- 4 Specify the following options, and then click OK:

Sub-columns Choose the number of columns you want the split the paragraph into.

Space Before Split / Space After Split Add space before or after the split paragraph.

Inside Gutter Determine the space between the split paragraphs.

Outside Gutter Determine the space between the outside of the split paragraphs and the margins.

Align or justify text vertically within a text frame

You can align or distribute lines of text in a frame along its vertical axis to help keep type vertically consistent among frames and their columns.

Using frame alignment, you can align text vertically (horizontally when using vertical type) in a plain-text frame with the frame as a base.

You can align text to the top, center, or bottom of the frame using each paragraph's leading and paragraph spacing values. You can also justify text vertically, which evenly spaces lines regardless of their leading and paragraph spacing values.

Typography

Vertical text alignment and justification is calculated from the baseline positions of each line of text in the frame. Keep the following in mind as you adjust vertical alignment:

- Align Top/Right is defined as the baseline of the first line of top-aligned text. The First Baseline Offset option in the Text Frame Options dialog box affects this value. Align Bottom/Left is defined as the baseline of the last line of bottom-aligned text.
- When the Grid Alignment option is applied to paragraphs with Align Top/Right, Center Justify, Align Bottom/Left, all lines will be aligned to the baseline grid. With the Justified option, only the first and last lines will be aligned to the baseline grid.
- If you adjust a text frame's Top or Bottom Inset values in the Text Frame Options dialog box, you change the location of the first or last baseline, respectively.
- The top of the frame is defined as the baseline of the first line of top-aligned text. The First Baseline Offset option in the Text Frame Options dialog box affects this value.
- The bottom of the frame is defined as the baseline of the last line of bottom-aligned text. Footnote text is not justified.
- When the Align to Baseline Grid option is applied to paragraphs with Top, Center, or Bottom alignment, all lines will be aligned to the baseline grid. With the Justified option, only the first and last lines will be aligned to the baseline grid.
- If you adjust a text frame's Top or Bottom Inset values in the Text Frame Options dialog box, you change the location of the first or last baseline, respectively.

1 Do one of the following:

- With the Selection tool, select a text frame.
- With the Type tool **T**, click in a text frame.

2 Choose Object > Text Frame Options.

Typography

- 3 In the Vertical Justification section of the Text Frame Options dialog box, choose Top/Right, Center, Bottom/Left, or Justify.
- 4 In the Vertical Justification section of the Text Frame Options dialog box, choose one of the following options in the Align menu:
 - To vertically align text down from the top of the frame, choose Top. (This is the default setting.)
 - To center lines of text in the frame, choose Center.
 - To vertically align lines of text up from the bottom of the frame, choose Bottom.
 - To evenly distribute lines of text vertically between the top and bottom of the frame, choose Justify.
- 5 If you choose Justify and you want to prevent the leading value from becoming disproportionately larger than the paragraph spacing value, specify a Paragraph Spacing Limit value. The space between paragraphs is expanded up to the value you specify; if the text still doesn't fill the frame, the space between lines is adjusted until the frame is filled. The paragraph spacing limit value is applied in addition to the Space Before or Space After values entered on the Paragraph panel.

Note: Be careful about vertically justifying multi-column text frames. If the last column contains only a few lines, too much white space may appear between the lines.

- 6 Click OK.

 An easy way to adjust the Paragraph Spacing Limit value is to select Preview, and then click the up or down arrow next to the Paragraph Spacing Limit value until paragraph spacing appears to be balanced with leading.

Composing CJK characters

Composing CJK characters

CJK composition

InCopy supports four methods developed for typesetting, including Adobe Japanese Single-line Composer, Adobe Japanese Paragraph Composer, Adobe Paragraph Composer, and Adobe Single-line Composer. Each Composer evaluates possible breaks in CJK and Roman text, and chooses those that best support the hyphenation and justification options specified for a given paragraph.

The Adobe Paragraph Composer

Considers a network of breakpoints for an entire paragraph, and thus can optimize earlier lines in the paragraph in order to eliminate especially unattractive breaks later on.

The Paragraph Composer approaches composition by identifying possible breakpoints, evaluating them, and assigning a weighted penalty to them based on such principles as evenness of letterspacing, word spacing, and hyphenation, or Roman words set to a language that supports hyphenation dictionaries.

 *You can use the Hyphenation dialog box to determine the relationship between better spacing and fewer hyphens.*

Adobe Japanese Paragraph Composer

Adobe Japanese Paragraph Composer, like the Paragraph Composer, evaluates breaks (where to wrap to the next line) in units of paragraphs. If characters are added to or deleted from a paragraph specified for this Composer, mojikumi may be modified on the line before the edit point because the Composer re-evaluates mojikumi in the whole paragraph in order to optimize it.

The Paragraph Composer approaches composition by identifying possible breakpoints, evaluating them, and assigning a weighted penalty based on principles of evenness of letterspacing, word spacing, and hyphenation.

Paragraph Composer evaluates breaks for the entire paragraph and fits mojikumi on the basis of character spacing, word spacing, and rules for even hyphenation. For CJK text, this is calculated as the difference between the actual value of mojikumi aki inserted for full justification or kinsoku processing and the optimum value set in the Mojikumi Settings dialog box. When the aki necessary for full line justification is more than the maximum aki, or when the aki necessary for kinsoku processing is less than the minimum aki, an H&J violation occurs.

The Adobe Single-line Composer

Offers a traditional approach to composing text one line at a time. This option is useful if you want to restrict composition changes from late stage edits, and you don't care about some lines in the paragraph being very loose while others fit perfectly.

Adobe Japanese Single-line Composer

Adobe Japanese Single-line Composer applies mojikumi by evaluating line breaks one line at a time, in the same way as Single-line Composer.

Change CJK composition preferences

1 Choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).

2 Under Mojikumi Compatibility Mode, do any of the following:

- Select Use New Vertical Scaling to use the InDesign method of vertical scaling. Roman text is typically rotated on its side, whereas CJK text may be upright. In previous versions of InDesign, when you set glyph scaling in the Character panel, the X Scale and Y Scale attributes cause different results depending on the orientation of the characters being scaled. In CS2 or later versions of InDesign and InCopy, scaling affects all text in the line the same way, regardless of whether it's rotated or upright. If the text isn't upright in vertical, the X Scaling and Y Scaling will be exchanged, resulting in the Roman text being scaled in the same direction as the CJK upright text. This option is turned on for new documents and turned off for documents from InDesign CS and earlier.
- Select Use CID-Based Mojikumi to determine the correct JIS X 4051 Mojikumi Class using the glyphs (jikei) of the font used instead of Unicode. Selecting this option is especially useful when you're using OpenType fonts. This feature supports all CID fonts of AdobeJapan1-0 through AdobeJapan1-6. Unicode will be used with all other fonts.

3 Click OK.**Use mojikumi**

Mojikumi specifies text composition for spacing of Japanese and Chinese characters, roman characters, punctuation, special characters, line start, line end and numbers. For Korean text, mojikumi may not be applicable. You can also specify paragraph indents.

For Japanese text, the existing character spacing rules in InDesign follow the Japanese Industrial Standards (JIS) specification, JISx4051-1995. You can also select from InDesign predefined mojikumi sets. Furthermore, you can create specific mojikumi sets, and change the values for character spacing.

For Chinese text, you can use mojikumi display settings for Traditional Chinese and Simplified Chinese. If these options do not appear in the Mojikumi Set list, you can select them in the Mojikumi Options section of the Preferences dialog box.

InCopy includes 14 types of mojikumi presets for Japanese and 2 for Chinese. You can also modify the presets to be displayed in Preferences, and you can determine whether CID-Based Mojikumi is used.

In InCopy, you can change the mojikumi settings of a paragraph, but you can't create a custom mojikumi set or change custom mojikumi settings as in InDesign. For details, see InDesign Help.

Apply a mojikumi set to a paragraph

- 1** Select the target paragraph or frame. To change the default setting, confirm that no paragraph or frame is selected.
- 2** Choose a set from the Mojikumi pop-up menu in the Paragraph panel or Control panel.

To disable mojikumi settings, choose None from the Mojikumi pop-up menu.

Note: To determine which mojikumi settings appear in the Mojikumi pop-up menu, select the settings in the Mojikumi Options section of the Preferences dialog box.

Change the display of mojikumi presets

- 1** Choose Edit > Preferences > Mojikumi Options (Windows) or InCopy > Preferences > Mojikumi Options (macOS).
- 2** Select the items you wish to display in the Mojikumi pop-up menu and click OK.

The Mojikumi Preset section item names are shown in gray, and items that cannot be selected are mojikumi sets, which are currently applied to paragraphs or default mojikumi sets.

Change mojikumi settings

You can edit the settings for spacing that you use a lot, such as the spacing between a period and following opening parenthesis, in a mojikumi set you create.

For example, when you want to compress the character spacing for parentheses in the text, from Okoshi yakumono in Yakumono, change the Middle Line setting for Open Parentheses, or Close Parentheses in Uke yakumono. The following settings are available: 50% Fixed, 50%(0%-50%), 50%(25%-50%), 0% Fixed, 0%(0%-50%). For opening parentheses, 50% Fixed leaves a half-width 50% aki before the parenthesis. In other words, it doesn't compress the aki. 50%(0%-50%) puts a half-width aki before the parenthesis, but depending on mojikumi settings may not make an aki at all. 50%(25%-50%) makes a half-width aki before the parenthesis, but depending on mojikumi settings may make an aki which is half the size (25%) of a half-width character. 0% Fixed always compresses aki. 0%(0%-50%) compresses aki, but depending on mojikumi settings may allow a half-width aki. Choose 0% Fixed if you always want to compress spacing before and after parentheses.

By clicking the triangular to the left of Open Parenthesis, Close Parenthesis, commas, periods, and middle punctuation in each of Okoshi Yakumono, Uke Yakumono and Chuzuki Yakumono within Yakumono, items such as round parentheses, corner brackets, Japanese commas, commas, Japanese periods, periods, nakaguro and colons are displayed, allowing setting of aki for each character type. If you apply these settings, brackets won't be compressed but you can adjust aki for round parentheses.

Furthermore, if you display Detailed, you can edit all classes, set the processing order for each class, and indicate differences between a specified mojikumi set and the current settings.

You can specify the desired value, minimum value, maximum value and order of priority to apply character spacing for each option. The minimum and maximum values are applied when you adjust the spacing for text that is fully justified by kinsoku. The more the Minimum and Maximum percentage values differ from the Desired percentage, the more scope you can give to InDesign to increase or decrease spacing when justifying the line.

Create a new mojikumi set

- 1 Do one of the following:
 - Choose Type > Mojikumi Settings > Basic or Detailed.
 - Choose Basic or Detailed from the Mojikumi Set menu in the Paragraph panel or Control panel.
- 2 Click New in the Mojikumi Settings dialog box.
- 3 Enter the name of the mojikumi set, specify the existing set on which the new one will be based, and click OK.
- 4 From Units, choose whether to use percentage (%) or Bu units, or to use Character Width/Bu.
- 5 Specify values for Begin Line, End Line and Middle Line for items in each section of Yakumono, Contiguous Yakumono, Paragraph Mojikumi Indent and Between CJK and Roman. The Middle Line value is used to compress lines for kinsoku (specify a value less than the Begin Line value). The End Line value is used to spread lines for fully justified text (specify a value greater than the Middle Line value).
- 6 For item names in each section that has a triangle indicator, you can specify mojikumi settings in further detail for each character. For example, to display items, click the triangle to the left of Open Parenthesis in Okoshi Yakumono in the Yakumono section. The three items Open Bracket, Open Round Parenthesis, and Other Opening Parenthesis are displayed, allowing you to set mojikumi settings for each character class.
- 7 When settings are complete, click Save or OK to save the settings. Click Cancel if you don't want to save the settings.

Depending on the character type, you can specify the same values for Begin Line, Middle Line, and End Line if you don't want to change the spacing.

Edit detailed settings for mojikumi

1 Do one of the following:

- Select Type > Mojikumi Settings > Detailed.
- In the Paragraph panel or Control panel, choose Advanced Settings From Mojikumi.
- Click Detailed in the Mojikumi Settings dialog box.

- 2 Select a mojikumi set to edit from the Mojikumi pop-up menu or click New to create a new set. You can also import a mojikumi set from another document by clicking Import.
- 3 From the Character Class pop-up menu at the bottom of the Mojikumi menu, select the character class to edit its character aki settings. A list of settings that can be edited is included in the class. You can individually set Open Parenthesis, Close Parenthesis, commas, periods or middle punctuation items, but you can also specify aki in more detail for individual characters such as Japanese periods or Roman periods.
- 4 Choose Previous Class or Next Class from the Before & After pop-up menu, and set whether the class aki value is to be entered before or after the entered character. To set the aki for a character following a Japanese period, for example, choose Japanese Period from the Character Class popup menu, and select previous character class from the Before & After pop-up menu.
- 5 For each item, set Minimum, Desired, and Maximum values. The Minimum value is used to compress lines for kinsoku (specify a value less than the Desired value). The maximum value is used to spread lines for fully justified text (specify a value greater than the Desired value).
- 6 For item names that have a triangle indicator, you can further specify mojikumi settings in detail for each character. For example, click the triangle to the left of Open Parenthesis to display the items. The three items Open Bracket, Open Round Parenthesis, Other Opening Parenthesis are displayed, allowing you to set mojikumi settings for each character.

Typography

- 7 Specify the order of compression priority in Priority for each class, to determine the order of compression for each. When you specify 1 for any character class, characters given greater values will be processed afterwards, in increasing order of priority, and when you specify None they are processed last. You can assign the same value (1 to 9) in several aki options.
- 8 From the Indicate Differences menu, specify an option to indicate which mojikumi table is being compared. When a different table is selected, any values that are different from that table are highlighted in blue.
- 9 Click Save, or click Cancel if you don't want to save the settings.

Change the name of a custom mojikumi set

- 1 In the Mojikumi Settings dialog box, choose a custom mojikumi set from the Mojikumi pop-up menu, and click Rename.
- 2 Enter the new name in the Rename dialog box and click OK.

You cannot rename default mojikumi sets.

Delete a custom mojikumi set

In the Mojikumi Settings dialog box, choose a custom mojikumi set from the Mojikumi pop-up menu, and click Delete Set.

All the text to which the mojikumi set was applied will return to default settings. You cannot delete predefined mojikumi sets. You cannot delete default InDesign mojikumi sets.

 *When you compose Japanese text with a lot of half-width spaces or Roman parenthesis, problems that need to be resolved relating to text composition increase. It is recommended that you avoid using Roman parenthesis, and use full-width parenthesis for Japanese composition. Only use Roman parenthesis when using relatively long English sentences in Japanese text, or when a more serious problem results if you don't use Roman parenthesis.*

Use kinsoku settings

Kinsoku specifies line breaks for Asian text. Characters that cannot be placed at the beginning or end of a line are known as kinsoku characters. For Japanese text, you can use hard kinsoku sets and soft kinsoku sets. Soft kinsoku sets omit long vowel symbols and small hiragana characters. You can use these existing sets, or add or delete kinsoku characters to create new sets. Chinese and Korean versions include special kinsoku sets.

Select kinsoku settings for a paragraph

- 1 Select a paragraph or frame.
- 2 In the Paragraph panel, choose an option from the Kinsoku Set list.

Create a new kinsoku set

- 1 Do one of the following.
 - Select Type > Kinsoku Settings.
 - In the Paragraph panel or Control panel, choose Settings from the Kinsoku pop-up menu, and display the Kinsoku Settings dialog box.
- 2 Click New in the Kinsoku Settings dialog box. It is possible to import from other documents, but there is no import button as with the Mojikumi Settings.
- 3 Enter the name of the kinsoku set, and specify the existing set on which the new one will be based.

Typography

- 4 To add a character to a field, select the field, and do one of the following:
 - Enter a character in the Add Character box, and click Add to insert in the list box.
 - In the Add Character pop-up menu, specify the code system (Shift JIS, JIS, Kuten, Big5, GB, Johab, or Unicode), enter the code into the Add Character box and click Add.
- 5 To delete a character in the list box, select the character and press Backspace (Windows) or Delete (macOS).
- 6 To check the currently selected character code, from the Add Character pop-up menu select Shift JIS, JIS, Kuten, Big5, GB, Johab, or Unicode. The code system is displayed in the Add Character text box.
- 7 Click Save to save the settings. Click Cancel if you do not want to save the settings.

Delete a kinsoku set

- 1 In the Kinsoku Shori Set dialog box, choose the kinsoku setting you want to delete from the Kinsoku Settings pop-up menu.
- 2 Click Delete Set.

You cannot delete predefined kinsoku settings.

Specify whether to push in or push out kinsoku text

You can determine whether text is pushed in or pushed out to prevent kinsoku characters from beginning or ending the line.

- 1 Select the paragraph or frame.
- 2 From the Paragraph panel menu or Control panel menu, choose an option from the Kinsoku Break Type menu:
 - Choose Push In First to prioritize fitting kinsoku characters onto the same line.
 - Choose Push Out First to prioritize moving kinsoku characters to the next line.
 - Choose Push Out Only to always move kinsoku characters to the next line.
 - Choose Prioritize Adjustment Amount to push in text when pushing out that text would result in greater expansion of character space than pushing it in would compress the character space.

Force highlighting of kinsoku text

You may want to check where kinsoku has been applied, as several elements may affect the text composition. When you set the option to highlight kinsoku text to on, kinsoku items are highlighted in blue-gray. Kinsoku items that have been pushed in to keep on the same line are highlighted in red, and kinsoku items that have been pushed out so as not to be on the previous line are highlighted in blue. You can edit and amend the composition of these highlighted items manually.

- 1 Select Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS).
- 2 Select Kinsoku, and then click OK.

Turn bunri-kinshi on or off

When bunri-kinshi is on, the characters specified in the Bunri-kinshi Characters section of the Kinsoku Settings dialog box will not be split across lines, and will not be spaced out during full justification.

- 1 Select the text you want to affect.
- 2 Choose Bunri-Kinshi from the Paragraph panel menu or Control panel menu.

Use rensuuji

Rensuuji protects numbers from breaking. Furthermore, this option processes punctuation spacing in number strings according to JIS specifications.

- 1 Select the text you want to affect.
- 2 To turn rensuuji on, choose Rensuuji from the Paragraph panel menu or Control panel menu.

Absorb ideographic space

If a space falls at the end of the line, the space may wrap to the next line, causing an jagged appearance. You can select an option to prevent a line from beginning with a space.

- 1 Select the text you want to affect.
- 2 Choose Absorb Ideographic Space At Line End in the Paragraph panel menu or Control panel menu to prevent a line from beginning with a space.

You can also make this option part of a paragraph style. This option is located in the Japanese Composition Settings section when creating or editing a style.

Turn off Roman word wrap

When the Arbitrary Hyphenation option is selected, Roman words can be broken without using Roman hyphenation rules, and no hyphen character (-) appears at the end of the line. If this option is not selected, Roman hyphenation rules are used for word breaks.

The Arbitrary Hyphenation option takes effect only if a CJK language is applied to the text. This option has no effect on text to which Roman languages are applied.

- 1 Select the text you want to affect.
- 2 Choose Arbitrary Hyphenation in the Paragraph panel menu or Control panel menu.

You can also make this option part of a paragraph style. This option is located in the Japanese Composition Settings section when creating or editing a style.

Apply kinsoku hanging

Hanging controls whether or not you hang Japanese punctuation marks such as periods or commas outside the margin, and align to the edge of the text frame. Specify hanging characters in Hanging Punctuation in the Kinsoku Settings dialog box.

- 1 Select the text you want to affect.

Typography

- 2 To turn on hanging, choose one of the following hanging methods from the Kinsoku Hang Type command in the Paragraph panel menu or Control panel menu.

None No hanging.

Regular When the paragraph is set to justify or justify all lines, positioning is applied to include hanging characters.

Forced Forced When the paragraph is set to justify or align on both sides, the hanging characters are first forced to hang before positioning is applied. Forced hanging is only applied when paragraph justification is applied.

Rotate half-width characters in vertical text

- 1 Select the text you want to affect.
- 2 From the Paragraph panel menu or Control panel menu, choose Roman rotation in Vertical Text.

The direction of half-width characters such as Roman text or numbers changes in vertical text. By setting Roman Rotation in Vertical Text, you can rotate these characters vertically in the paragraph.

When you set this option to on, half-width characters are rotated individually.

Turn warichu on or off

Warichu can be set as inline note for the body text. Warichu usually consists of two lines enclosed within parentheses.

- 1 Select the text.
- 2 Do one of the following.
 - Choose Warichu from the Character panel menu or Control panel menu.
 - Choose Warichu Settings from the Character panel menu or Control panel menu, select Warichu in the Warichu Settings dialog box, and then click OK.

Change warichu options

- 1 Select the text you want to affect.
- 2 Choose Warichu Settings from the Character panel menu or Control panel menu.

Typography

- 3 For Number Of Lines, specify how many lines of text will appear as warichu characters.
- 4 For Line Spacing, specify the distance between the lines of warichu characters.
- 5 For Warichu Size, select the size of warichu characters as a percentage of the size of the parent text.
- 6 To align Warichu characters, select an alignment option. For example, in a vertical frame grid, selecting Left/Top aligns the beginning of the warichu characters at the top of the frame. In addition, if Auto is set, justification occurs automatically based on the warichu size or the parent text. The alignment proxy shows how the warichu text appears relative to the parent text.
- 7 In the Line Breaking Options section, specify the minimum number of characters required before and after the line breaks to start a new line, and then click OK

Changing spacing between characters in CJK text

Adjust kerning for the half-width space between Roman words

With the Type tool  select a range of text, and do one of the following:

- To add space between selected words, press Alt+Ctrl+\ (Windows) or Option+Command+\ (macOS).
- To remove space between selected words, press Alt+Ctrl+Backspace (Windows) or Option+Command+Delete (macOS).
- To multiply the kerning adjustment by 5, hold down Shift as you press the keyboard shortcut.

Adjust character tsume in CJK composition

Applying tsume to characters causes the space around them to be compressed proportionally. However, the vertical and horizontal scaling of the characters remains unchanged.

- 1 Select the text to which you want to apply tsume.
- 2 Input the percentage in Tsume  in the Character panel or the Control panel.

You can also check which tsume or tracking was applied for each character by highlighting the affected text.

Using grid tracking to adjust character spacing

One way in which you can compress aki between characters is to specify the line spacing for the frame grid itself and adjusting tracking for placed text. This is a form of character compression that uses a feature called Adjust Tracking With CJK Grid in the Character panel menu or the Control panel (also called grid tracking).

Some characters in CJK fonts are smaller than the embox, resulting in a large aki between characters when they are placed on the frame grid. Setting tsume in this way for the grid itself is convenient because it allows mojikumi where characters are properly aligned in the grid. This setting can also be saved as a grid format.

The Character Aki default in the Frame Grid Settings dialog box is set to “0”. In automated typography, this tracking is known as “Beta”. Setting this to a negative value for mojikumi causes the right grid to overlap the left grid in accordance with the set value. Characters input to the grid will be aligned on the basis of the center of the each grid, so the spacing for each character will be compressed. In addition, depending on the mojikumi settings, character forms adjusted to less than the maximum width will change on the basis of the value proportion of Line Spacing Tsume. For instance, when mojikumi is set to half spacing for yakumono such as parentheses, by setting the Character Aki in the grid to -1H, yakumono will be compressed to half of -1H, thus -0.5H. However, because character spacings based on tracking in this grid are not applied to Roman text, character spacing for Roman text will not be compressed in line with tracking. In addition, because this tracking value is applied to the grid itself, it is handled as an absolute value. For this reason, even if the text font size changes, the tracking value does not.

This feature is enabled by default. To disable this feature, select Adjust Tracking With CJK Grid from the Character panel menu or Control panel, and deselect the box to the left of the item name.

Adjust tracking by using Grid Jidori

You can justify text for specified grid characters by setting grid jidori. For example, if you select 3 characters entered and set jidori to 5, the 3 characters will be spread evenly across the grid for 5 character spaces.

- 1 Select a range of characters.
- 2 In Grid Jidori  in the Character panel or Control panel, enter a value in the text box or select one from the pop-up menu.

Note: Use the Grid Jidori feature in the frame grid. It may not function properly in a text frame.

Formatting characters

Apply baseline shift

Use Baseline Shift to move a selected character up or down relative to the baseline of the surrounding text. This option is especially useful when you're hand-setting fractions or adjusting the position of inline graphics.

- 1 Select text.
- 2 In the Character panel or Control panel, type a numeric value for Baseline Shift $\frac{A}{\frac{a}{T}}$. Positive values move the character's baseline above the baseline of the rest of the line; negative values move it below the baseline.

 *To increase or decrease the value, click in the Baseline Shift box, and then press the Up or Down Arrow key. Hold down Shift while you press the Up or Down Arrow key to change the value in greater increments.*

To change the default increment for baseline shift, specify a value for Baseline Shift in the Units & Increments section of the Preferences dialog box.

Make characters superscript or subscript in a non-OpenType font

- 1 Select text.
- 2 Choose Superscript or Subscript in the Character panel menu or in the Control panel.

When you choose Superscript or Subscript, a predefined baseline shift value and type size are applied to the text.

The values applied are percentages of the current font size and leading, and are based on settings in the Type Preferences dialog box. These values do not appear in the Baseline Shift or Size boxes of the Character panel when you select the text.

Note: You can change the default size and position of superscripts and subscripts using Advanced Type preferences.

Apply underline or strikethrough

The default weight of an underline and strikethrough depends on the size of the type.

Apply underline or strikethrough

- 1 Select text.
- 2 Choose Underline or Strikethrough in the Character panel menu or the Control panel.

Change underline or strikethrough options

Creating custom underlining is especially useful when you want to create an even underline below characters of different sizes, or for creating special effects, such as background highlighting.

- 1 From the Character panel menu or the Control panel menu, choose Underline Options or Strikethrough Options.

Typography

2 Do any of the following, and then click OK:

- Select Underline On or Strikethrough On to turn on underline or strikethrough for the current text.
- For Weight, choose a weight or type a value to determine the thickness of the underline or strikethrough line.
- For Type, select one of the underline or strikethrough options.
- For Offset, determine the vertical position of the line. The offset is measured from the baseline. Negative values move the underline above the baseline and the strikethrough below the baseline.
- Select Overprint Stroke when you want to make sure that the stroke doesn't knock out underlying inks on a printing press.
- Choose a color and tint. If you specified any line type other than solid, choose a gap color or gap tint to change the appearance of the area between dashes, dots, or lines.
- Select Overprint Stroke or Overprint Gap if the underline or strikethrough will be printed over another color, and you want to avoid errors that can occur with printing misregistration.

 To change the underline or strikethrough options in a paragraph or character style, use the Underline Options or Strikethrough Options section of the dialog box that appears when you create or edit the style.

Apply ligatures to letter pairs

InDesign can automatically insert *ligatures*, which are typographic replacement characters for certain letter pairs, such as “fi” and “fl,” when they are available in a given font. The characters that InDesign uses when the Ligature option is selected appear and print as ligatures, but are fully editable, and do not cause the spell checker to flag a word erroneously.

With OpenType fonts, when you choose Ligatures from the Character panel menu or Control panel menu, InDesign produces any standard ligature defined in the font, as determined by the font designer. However, some fonts include more ornate, optional ligatures, which can be produced when you choose the Discretionary Ligatures command.

- 1 Select text.
- 2 Choose Ligatures from the Character panel menu or the Control panel menu.

Change the color, gradient, or stroke of text

You can apply colors, gradients, and strokes to characters and continue to edit the text. Use the Swatches panel and Stroke panel to apply colors, gradients, and strokes to text, or change Character Color settings when creating or editing a style.

Typography

A Swatch affects fill or stroke B Swatch affects container or text C Tint percentage

1 Do one of the following:

- To apply color changes to text inside a frame, use the Type tool  to select text.
- To apply color changes to all text in a frame, use the Selection tool  to select the frame. When applying color to the text rather than the container, make sure that you select the Formatting Affects Text icon  in the Tools panel or in the Swatches panel.

2 In the Tools panel or in the Swatches panel, select whether you want to apply the color change to the fill or stroke. If you select Stroke, the color change affects only the outline of characters.

3 Do any of the following:

- In the Swatches panel, click a color or gradient swatch.
- In the Stroke panel, specify a weight or other stroke options.

You can also apply a gradient to text by dragging across the selected text using either the Gradient Swatch tool  or the Gradient Feather tool .

 *To create reverse type, you can change the text fill color to white or [Paper] and the frame's fill color to a dark color. You can also create reverse type by using a paragraph rule behind text; however, if the rule is black, you'll need to change the type to white.*

Change the color and gradient of text

You can apply colors and gradients to the stroke and fill of characters with the Swatches panel. For a linked story, you can apply any colors or gradients defined by the linked InDesign layout. For a stand-alone story, you can apply any of the default colors or new colors you create for the document.

Note: You cannot create gradients in InCopy. Gradients only appear when imported from InDesign.

Typography

A Swatch affects fill or stroke B Swatch affects container or text C Tint percentage

Change the color of text

- 1 Using the Type tool , select the text you want to color.
- 2 In the Swatches panel (choose Window > Swatches), click a color or gradient swatch.

Note: You can apply colors to text in either Galley, Story, or Layout view; however, color changes are visible only in Layout view.

Specify the type of swatches to display

- 1 Choose Window > Swatches to open the Swatches panel.
- 2 At the bottom of the panel, specify one of the following:
 - To see all color, tint, and gradient swatches, click the Show All Swatches button.
 - To see only process color, spot color, and tint swatches, click the Show Color Swatches button.
 - To see only gradient swatches, click the Show Gradient Swatches button.

Add transparency effects to text

Use the Effects panel to add transparency effects, such as drop shadows, to text.

- 1 Use the Selection tool  to select the text frame.
- 2 Choose Object > Effect  > [effect].
- 3 Choose Text from the Settings For menu.

You can choose Object if you want the effects you choose to apply to the text frame's stroke and fill as well as the text inside it.
- 4 Specify the effect attributes and click OK.

If you want to change the text's blending mode or opacity settings, make these changes on the Effects panel.

Assign a language to text

Assigning a language to text determines which spelling and hyphenation dictionary is used. Assigning a language does not change the actual text.

1 Do any of the following:

- To apply the language only to selected text, select the text.
- To change the default dictionary used in InDesign, choose the language with no documents open.
- To change the default dictionary for a specific document, open the document, choose Edit > Deselect All, and then choose the language.

2 In the Character panel, choose the appropriate dictionary in the Language menu.

InDesign uses Proximity (and WinSoft for some languages) dictionaries for both spelling and hyphenation. These dictionaries let you specify a different language for as little as a single character of text. Each dictionary contains hundreds of thousands of words with standard syllable breaks. Changing the default language does not affect existing text frames or documents.

You can customize language dictionaries to ensure that any unique vocabulary you use is recognized and treated correctly.

InDesign includes a language locking feature that prevents CJK text from being assigned a non-CJK language.

A “Glockenspiel” in English B “Glockenspiel” in Traditional German C “Glockenspiel” in Reformed German

Change the case of type

The All Caps or Small Caps commands change the appearance of text, but not the text itself. Conversely, the Change Case command changes the case setting of selected text. This distinction is important when searching or spell-checking text. For example, suppose you type “spiders” in your document and apply All Caps to the word. Using Find/Change (with Case Sensitive selected) to search for “SPIDERS” will not find the instance of “spiders” to which All Caps was applied. To improve search and spell-check results, use the Change Case command rather than All Caps.

Change text to All Caps or Small Caps

All caps is a method used to capitalize all Roman text. Small caps is a method used to capitalize all Roman text and make it the approximate size of lowercase characters.

InDesign can automatically change the *case* of selected text. When you format text as small caps, InDesign automatically uses the small-cap characters designed as part of the font, if available. Otherwise, InDesign *synthesizes* the small caps using scaled-down versions of the regular capital letters. The size of synthesized small caps is set in the Type Preferences dialog box.

500 BC to AD 700

500 BC to AD 700

If you select All Caps or Small Caps in an OpenType font, InDesign creates more elegant type. If you're using an OpenType font, you can also choose All Small Caps from the Character panel menu or the Control panel.

- 1 Select text.
- 2 Choose All Caps or Small Caps in the Character panel menu or in the Control panel. If the text was originally typed in all caps, selecting Small Caps will not change the text.

Specify the size for small caps

- 1 Choose Edit > Preferences > Advanced Type (Windows) or InCopy > Preferences > Advanced Type (macOS).
- 2 For Small Caps, type a percentage of the original font size for text to be formatted as small caps. Then click OK.

Change capitalization

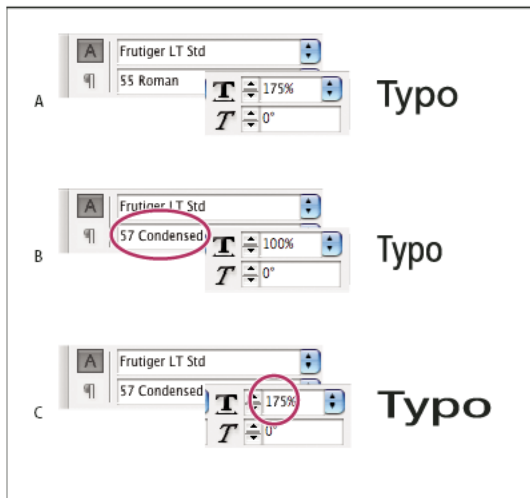

- 1 Select text.
- 2 Choose one of the following in the Type > Change Case submenu:
 - To change all characters to lowercase, choose Lowercase.
 - To capitalize the first letter of each word, choose Title Case.
 - To change all characters to uppercase, choose Uppercase.
 - To capitalize the first letter of each sentence, choose Sentence Case.

Note: The Sentence Case command assumes that the period (.), exclamation point (!), and question mark (?) characters mark the ends of sentences. Applying Sentence Case may cause unexpected case changes when these characters are used in other ways, as in abbreviations, file names, or Internet URLs. In addition, proper names may become lowercase when they should be uppercase.

Scale type

You can specify the proportion between the height and width of the type, relative to the original width and height of the characters. Unscaled characters have a value of 100%. Some type families include a true *expanded font*, which is designed with a larger horizontal spread than the plain type style. *Scaling* distorts the type, so it is generally preferable to use a font that is designed as condensed or expanded, if one is available.

Typography

A Unscaled type B Unscaled type in condensed font C Scaled type in condensed font

Adjust vertical or horizontal scaling

- 1 Select text you want to scale.
- 2 In the Character panel or Control panel, type a numeric value to change the percentage of Vertical Scaling  or Horizontal Scaling .

If the Use New Vertical Scaling in Vertical preference option is selected, the X and Y scale for Roman glyphs in vertical text will be reversed, making all text in the line scale in the same direction. If the Adjust Line Height With Char Scale option is selected in the Character panel menu, the Y scale of glyphs affects line height. When scaling frame grids, the Y scale is affected, so you may want to adjust the line height to avoid auto-gyoudori occurring on the scaled grid.

Scale text by resizing the text frame in InDesign

Do any of the following:

- Using the Selection tool, hold down Ctrl (Windows) or Command (macOS), and then drag a corner of the text frame to resize it.
- Using the Scale tool , resize the frame.

Determine the appearance of scaled text values

When you change the scale of a frame, the text inside the frame is also scaled. For example, when you double the size of a text frame, the text also doubles in size; 20-point text increases to 40 points.

You can change a preferences option to indicate how scaled text appears in panels:

- By default, with Apply To Content selected, the Font Size boxes in the Control panel and Character panel list the new size of text (such as 40 pt). If you select the Adjust Scaling Percentage option, the Font Size boxes display both the original and the scaled size of the text, such as “20 pt (40).”

Typography

- The scaling values in the Transform panel tell you the horizontal and vertical percentage by which the frame was scaled. By default, with Apply To Content selected, scaling values display at 100% after a text is scaled. If you select the Adjust Scaling Percentage option, the scaling values reflect the scaled frame, so doubling the scale of a frame displays as 200%.

Tracking scale changes to frames is useful if you have to revert a frame and the text inside it to their original size. It's useful as well for finding out by how much you changed the size of a frame. To track scale changes to frames and the text inside these frames:

- 1 Choose Edit > Preferences > General (Windows) or InDesign > Preferences > General (macOS).
- 2 Select Adjust Scaling Percentage, and then click OK.

Note the following:

- The Adjust Scaling Percentage preference applies to frames that you scale after the preference is turned on, not to existing frames.
- The Adjust Scaling Percentage preference stays with the text. The scaled point size continues to appear in parentheses even if you turn off the Adjust Scaling Percentage preference and scale the frame again.
- To remove the scaled point size from the Transform panel, choose Redefine Scaling as 100% in the Transform panel. Choosing this option doesn't change the appearance of the scaled frame.
- If you edit the text or scale a frame within threaded frames when the Adjust Scaling Percentage preference is selected, the text is scaled, even if it moves to a different frame. However, if Apply To Content is selected, any text that flows to a different frame as a result of editing is no longer scaled.

Skew type

- 1 Select text.
- 2 In the Character panel, type a numeric value for Skewing **T**. Positive values slant type to the right; negative values slant type to the left.

Note that applying an angle to type does not produce true italic characters.

Formatting Paragraphs

Adjust paragraph spacing

You can control the amount of space between paragraphs. If a paragraph begins at the top of a column or frame, InCopy does not honor the Space Before value. In such a case, you can increase the leading of the first line of the paragraph or increase the top inset of the text frame in InDesign.

- 1 Select text.
- 2 In the Paragraph panel or the Control panel, adjust the appropriate values for Space Before  and Space After. 

To ensure formatting consistency, change paragraph spacing in the paragraph styles you define.

Use drop caps

You can add drop caps to one or more paragraphs at a time. The drop cap's baseline sits one or more lines below the baseline of the first line of a paragraph.

The size of drop cap text differs depending on whether the drop cap characters in the first line are half-width roman or full-width CJK. When the drop cap characters in the first line are half-width roman, the cap height of the drop cap matches the cap height of the first line of text in the paragraph, and the Roman baseline of the drop cap matches the baseline of the last drop cap line in the paragraph. The embox top of the drop cap matches embox top of first line of paragraph, and the embox bottom of the drop cap matches the embox bottom of the last drop cap line in paragraph.

You can also create a character style that can be applied to the drop-cap characters. For example, you can create a tall cap (also called a *raised cap*) by specifying a 1-line, 1-character drop cap and applying a character style that increases the size of the first letter.

Create a drop cap

- 1 With the Type tool  selected, click in the paragraph where you want the drop cap to appear.
- 2 In the Paragraph panel or Control panel, type a number for Drop Cap Number Of Lines  to indicate the number of lines you want the drop cap to occupy.
- 3 For Drop Cap One Or More Characters , type the number of drop cap characters you want.
- 4 To apply a character style to the drop cap character, choose Drop Caps And Nested Styles from the Paragraph panel menu, and then choose the character style you created.

You can also use the Drop Caps And Nested Styles dialog box to align the drop cap to the text edge, reducing the amount of space on the left side of the drop cap, and adjust for drop cap letters with descenders, such as “g” and “y.” If you want to resize, skew, or change the typeface of the drop cap letter for added effect, select the letter or letters and make the formatting changes.

You can also use the Drop Caps And Nested Styles dialog box to adjust the drop cap in different ways. You can align the drop cap to the text edge, scale for descenders, ignore frame grid, pad the frame grid, and scale up/down to grid.

Remove a drop cap

- 1 With the Type tool  selected, click in the paragraph where the drop cap appears.
- 2 In the Paragraph panel or Control panel, type 0 for Drop Cap Number Of Lines or Drop Cap Number Of Characters.

Add rules (lines) above or below paragraphs

Rules are paragraph attributes that move and are resized along with the paragraph on the page. If you're using a rule with headings in your document, you may want to make the rule part of a paragraph style definition. The width of the rule is determined by the column width.

The offset for a rule above a paragraph is measured from the baseline of the top line of text to the bottom of the rule. The offset for a rule below a paragraph is measured from the baseline of the last line of text to the top of the rule.

A Rule above paragraph B Rule below paragraph

Add a rule above or below a paragraph

- 1 Select text.
- 2 Choose Paragraph Rules from the Paragraph panel menu or Control panel menu.
- 3 At the top of the Paragraph Rule dialog box, select Rule Above or Rule Below.
- 4 Select Rule On.

Note: If you want both a rule above and below, make sure that Rule On is selected for both Rule Above and Rule Below.

- 5 Select Preview to see what the rule will look like.
- 6 For Weight, choose a weight or type a value to determine the thickness of the rule. For Rule Above, increasing the weight expands the rule upwards. For Rule Below, increasing the weight expands the rule downward.
- 7 Select Overprint Stroke when you want to make sure that the stroke doesn't knock out underlying inks on a printing press.
- 8 Do one or both of the following:
 - Choose a color. The available colors are those listed in the Swatches panel. Select the Text Color option to make the rule the same color as the first character in the paragraph for Rule Above and the last character for Rule Below.

Typography

- Choose a tint or specify a tint value. The tint is based on the color you specified. Note that you can't create tints of the built-in colors None, Paper, Registration, or Text Color.
 - If you specified any line type other than solid, choose a gap color or gap tint to change the appearance of the area between dashes, dots, or lines.
- 9 Choose the width of the rule. You can choose either Text (from the left edge of text to the line end) or Column (from the left edge of the column to the right edge of the column). If the left edge of the frame has a column inset, the rule begins at the inset.
 - 10 To determine the vertical position of the rule, type a value for Offset.
 - 11 To make sure that the rule above text is drawn within the text frame, select Keep In Frame. If this option isn't selected, the rule can appear outside the text frame.

 *To make sure the paragraph rule at the top of one column aligns with the text at the top of the adjacent column, select Keep In Frame.*
 - 12 Set left or right indents for the rule (not for text) by typing values for Left Indent and Right Indent.
 - 13 Select Overprint Stroke if the paragraph rule will be printed over another color and you want to avoid errors that can occur with printing misregistration. Then click OK.

Remove a paragraph rule

- 1 Using the Type tool , click in the paragraph containing the paragraph rule.
- 2 Choose Paragraph Rules from the Paragraph panel menu or Control panel menu.
- 3 Deselect Rule On and click OK.

Ways to control paragraph breaks

You can eliminate orphans and widows, words or single lines of text that become separated from the other lines in a paragraph. *Orphans* fall at the bottom of a column or page, and *widows* fall at the top of a column or page. Another typographic problem to avoid is a heading that stands alone on a page with the following paragraph on the next page. You have several options for fixing widows, orphans, short exit lines, and other paragraph break problems:

Discretionary hyphens A discretionary hyphen (Type > Insert Special Character > Hyphens And Dashes > Discretionary Hyphen) appears only if the word breaks. This option prevents the common typographic problem of hyphenated words, such as “care-giver,” appearing in the middle of a line after text reflows. Similarly, you can also add a discretionary line break character.

No Break Choose No Break from the Character panel menu to prevent selected text from breaking across a line.

Nonbreaking spaces Insert a nonbreaking space (Type > Insert White Space > *[nonbreaking space]*) between words you want to keep together.

Keep Options Choose Keep Options from the Paragraph panel menu to specify how many lines in the following paragraph remain with the current paragraph.

Start Paragraph Use Start Paragraph in the Keep Options dialog box to force a paragraph (usually a title or heading) to appear at the top of a page, column, or section. This option works especially well as part of a heading paragraph style.

Hyphenation Settings Choose Hyphenation from the Paragraph panel menu to change hyphenation settings.

Edit text Editing text may not be an option depending on the kind of document you work with. If you have license to rewrite, then subtle rewording can often create a better line break.

Use a different composer In general, use Adobe Paragraph Composer to let InDesign compose paragraphs automatically. If a paragraph isn't composed the way you'd like, choose Adobe Single-line Composer from the Paragraph panel menu or Control panel menu and adjust selected lines individually. See [Compose text](#).

In general, use Adobe Japanese Paragraph Composer or Adobe Paragraph Composer to let InDesign compose paragraphs automatically. If a paragraph isn't composed the way you'd like, choose Adobe Japanese Single-line Composer or Adobe Single-line Composer from the Paragraph panel menu or Control panel menu and adjust selected lines individually.

Control paragraph breaks using Keep Options

You can specify how many lines of the following paragraph remain with the current paragraph as it moves between frames—a convenient way to ensure that headings don't become isolated from the body text they introduce. InDesign can highlight the paragraphs that sometimes break in violation of your settings.

You may not want to use Keep Options if your document does not require your columns to share the same last baseline.

 *To highlight paragraphs that violate Keep Options, choose Edit > Preferences > Composition (Windows) or InCopy > Preferences > Composition (macOS), select Keep Violations, and click OK.*

- 1 Select the paragraph or paragraphs you want to affect.
- 2 Choose Keep Options in the Paragraph panel menu or Control panel menu. (You can also change keep options when creating or editing a paragraph style.)
- 3 Choose Keep Options in the Paragraph panel menu. (You can also change keep options when creating or editing a paragraph style.)
- 4 Select any of these options and then click OK:
 - Select Keep With Previous to keep the first line of the current paragraph with the last line of the previous paragraph.
 - For Keep With Next _ Lines, specify the number of lines (up to five) of the subsequent paragraph that the last line of the current paragraph stays with. This option is especially useful for making sure that a heading stays with the next few lines of the paragraph that follows it.
 - Select the Keep Lines Together option and select All Lines In Paragraph to prevent the paragraph from breaking.
 - Select the Keep Lines Together option, select At Start/End Of Paragraph, and specify the number of lines that must appear at the beginning or ending of the paragraph to prevent orphans and widows.
 - For Start Paragraph, choose an option to force InDesign to push the paragraph to the next column, frame, or page. If Anywhere is selected, the start position is determined by the Keep Line Settings option. For other options, they will be forced to start from these positions.

 *When you create paragraph styles for headings, use the Keep Options panel to make sure that your headings remain with the paragraph that follows them.*

Create hanging punctuation

The Optical Margin Alignment function is for Roman text.

Punctuation marks and letters such as “W” can make the left or right edges of a column appear to be misaligned. Optical Margin Alignment controls whether punctuation marks (such as periods, commas, quotation marks, and dashes) and edges of letters (such as W and A) hang outside the text margins, so that the type looks aligned.

- 1 Select a text frame, or click anywhere in the story.
- 2 Choose Type > Story.
- 3 Select Optical Margin Alignment.
- 4 Select a font size to set the appropriate amount of overhang for the size of type in your story. For optimal results, use the same size as the text.

 *To turn off Optical Margin Alignment for an individual paragraph, choose Ignore Optical Margin from the Paragraph panel menu or Control panel menu.*

Formatting text

Format text

Use the Control panel to change the appearance of text. When text is selected or when the insertion point is placed in text, the Control panel displays either the character formatting controls or the paragraph formatting controls, or a combination of both, depending on your monitor resolution. These same text formatting controls appear in the Character panel and Paragraph panel. You can also use the Character panel and Paragraphs panel to change the appearance of text.

Use the Character panel and Paragraphs panel to change the appearance of text. In InDesign, you can also use the Control panel to format text. The Control panel is not available in InCopy.

Note the following methods of formatting text:

- To format characters, you can use the Type tool  to select characters, or you can click to place the insertion point, select a formatting option, and then begin typing.
- To format paragraphs, you don't need to select an entire paragraph—selecting any word or character, or placing the insertion point in a paragraph will do. You can also select text in a range of paragraphs.

Typography

- To set the formatting for all future text frames that you'll create in the current document, make sure that the insertion point is not active and that nothing is selected, and then specify text formatting options. To set default text formatting for all new documents, close all documents, and then specify the text settings.

- Select a frame to apply formatting to all text inside it. The frame cannot be part of a thread.
- Use paragraph styles and character styles to format text quickly and consistently.

- 1 Select the Type tool .
- 2 Select the Type tool  or Vertical Type tool .
- 3 Click to place an insertion point, or select the text that you want to format.
- 4 In the Control panel, click the Character Formatting Control icon  or the Paragraph Formatting Control icon .

A Character formatting controls B Paragraph formatting controls

- 5 In the Control panel, click the Character Formatting Control icon  or the Paragraph Formatting Control icon .

A Character formatting controls B Paragraph formatting controls

- 6 Choose Type > Paragraph or Type > Character to display the Paragraph or Character panel.
- 7 Specify formatting options.

Text formatting precedence

To format text with attributes such as font style and text direction, you can use several different methods. For example, you can use the Control panel, frame grid options, or named grids or text styles. If you use more than one method and attributes conflict with each other, InDesign must choose which attribute to use. The order of precedence is as follows:

- 1 Character attribute overrides
- 2 Character style
- 3 Paragraph attribute overrides
- 4 Paragraph style
- 5 CJK grid attributes (either from a named grid or from Frame Grid Options dialog box)
- 6 Application default (root paragraph style)

For example, if you specify one font size in the Frame Grid Options dialog box and a different font size in a character style, the font size from character style is used. Similarly, if you include both a paragraph style and a named grid in an object style, the paragraph style takes precedence over the named grid.

Format a frame grid

When you select a frame grid, options for formatting the grid are displayed in the Control panel.

- 1 Using a selection tool, select a frame grid.
- 2 Select any options in the Control panel.

A Reference point B X Location C Y Location D Width E Height F Vertical scaling G Horizontal scaling H Character aki I Line aki J Grid format name K Grid view L Font size M Frame grid characters per line N Number of lines O Number of columns P Column gutter

Copy type attributes (Eyedropper)

You can use the Eyedropper tool to copy type attributes such as character, paragraph, fill, and stroke settings, and then apply those attributes to other type. By default, the Eyedropper tool copies all type attributes. To customize the attributes you want to copy with the Eyedropper tool, use the Eyedropper Options dialog box.

The Eyedropper tool is available only in Layout View.

Copy type attributes to unselected text

- 1 With the Eyedropper tool , click the text that is formatted with the attributes you want to copy. (The text can be in another open document.) The eyedropper pointer reverses direction, and appears full , to indicate that it's loaded with the attributes you copied. When you position the eyedropper pointer over text, an I-beam appears next to the loaded eyedropper .
- 2 With the Eyedropper tool, select the text you want to change.

The selected text takes on the attributes loaded in the eyedropper. As long as the Eyedropper tool is selected, you can continue to select text to apply formatting.

- 3 To deselect the Eyedropper tool, click another tool.

 To clear the formatting attributes currently held by the eyedropper tool, press **Alt** (Windows) or **Option** (macOS) while the Eyedropper tool is loaded. The Eyedropper tool reverses direction and appears empty  to indicate that it's ready to pick up new attributes. Click an object containing the attributes you want to copy, and then drop the new attributes on another object.

If you use the Eyedropper tool to copy a paragraph style from text in one document to text in another, and the paragraph style has the same name but different sets of attributes, any style differences will appear as local overrides to the destination style.

Copy type attributes to selected text

- 1 With the Type tool  or Path Type tool , select the text to which you want to copy attributes.
- 2 Using the Eyedropper tool , click the text from which you want to copy attributes. (The text from which you want to copy attributes must be in the same InDesign document as the text you want to change.) The Eyedropper tool reverses direction and appears full , to indicate that it's loaded with the attributes you copied. The attributes are applied to the text you selected in step 1.

Change which text attributes the Eyedropper tool copies

- 1 In the toolbox, double-click the Eyedropper tool.
- 2 Choose Character Settings or Paragraph Settings in the Eyedropper Options dialog box.
- 3 Select the attributes you want to copy with the Eyedropper tool, and then click OK.

 To copy or apply paragraph attributes only without having to change settings in the Eyedropper Options dialog box, hold down Shift as you click text with the Eyedropper tool.

Use Quick Apply

Use Quick Apply to find and apply styles, menu commands, scripts, variables, and most other commands that can be found in the Keyboard Shortcuts dialog box.

- 1 Select the text or frame to which you want to apply the style, menu command, script, or variable.
- 2 Choose Edit > Quick Apply, or press Ctrl+Enter (Windows) or Command+Return (macOS).
- 3 Start typing the name of the item you want to apply.

The name you type doesn't need to be an exact match. For example, typing he will locate styles such as Head 1, Head 2, and Subhead, as well as Help menu commands such as Help Menu > InDesign Help.

 You can narrow the search to only a single category by typing the appropriate prefix at the beginning of the search, such as m: for menu or p: for paragraph styles. To view a list of prefixes, click the down arrow to the left of the Quick Apply text box. You can deselect categories in this list that you don't want to appear.

Typography

4 Select the item you want to apply, and then:

- To apply a style, menu command, or variable, press Enter or Return.
- To apply a paragraph style and remove overrides, press Alt+Enter (Windows) or Option+Return (macOS).
- To apply a paragraph style and remove overrides and character styles, press Alt+Shift+Enter (Windows) or Option+Shift+Return (macOS).
- To apply an item without closing the Quick Apply list, press Shift+Enter (Windows) or Shift+Return (macOS).
- To close the Quick Apply list without applying an item, press Esc or click anywhere else in the document window.
- To edit a style, press Ctrl+Enter (Windows) or Command+Return (macOS).

 *When the Quick Apply list is displayed, press the left and right arrow keys to scroll through the edit field; press the up and down arrow keys to scroll through the list of items.*

Chapter 8: Tables

Formatting tables

Formatting tables

Use the Control panel or Character panel to format text within a table—just like formatting text outside a table. In addition, two main dialog boxes help you format the table itself: Table Options and Cell Options. Use these dialog boxes to change the number of rows and columns, to change the appearance of the table border and fill, to determine the spacing above and below the table, to edit header and footer rows, and to add other table formatting.

Use the Table panel, the Control panel, or the context menu to format the table structure. Select one or more cells and then right-click (Windows) or Control-click (macOS) to display a context menu with table options.

Resize columns, rows, and tables

You can resize columns, rows, and tables using a number of different methods.

Resize columns and rows

- 1 Select cells in the columns and rows you want to resize.
- 2 Do one of the following:
 - In the Table panel, specify Column Width and Row Height settings.
 - Choose Table > Cell Options > Rows And Columns, specify Row Height and Column Width options, and then click OK.

Note: If you select *At Least* to set a minimum row height, rows increase in height as you add text or increase the point size. If you select *Exactly* to set a fixed row height, the row height does not change when you add or remove text. A fixed row height often results in an overset condition in the cell.

- Position the pointer over the edge of a column or row so that a double-arrow icon (↔ or ⇅) appears, and then drag left or right to increase or decrease the column width, or drag up or down to increase or decrease row height.

Lee	
Luebke	
Sanchez	
Stewart	
Rhoades	

Lee	
Luebke	
Sanchez	
Stewart	
Rhoades	

By default, row height is determined by the slug height of the current font. Thus, row height also changes if you change the point size of type for entire rows of text, or if you change the row height setting. The maximum row height is determined by the Maximum setting in the Rows And Columns section of the Cell Options dialog box.

Resize rows or columns without changing the table width

- Hold down Shift while dragging an inside row or column edge (not the table boundary). One row or column gets bigger as the other gets smaller.
- To resize rows or columns proportionally, hold down Shift while dragging the right table border or bottom table edge.

Holding down Shift while dragging the right table edge will resize all the columns proportionally; holding down Shift while dragging the bottom table edge will resize all rows proportionally.

Dragging the lower edge of the table (in the case of vertical text, the left hand corner) while holding down Shift will cause the height of the rows (or the width of vertical text rows) to resize proportionally.

Resize the entire table

Using the Type tool , position the pointer over the lower-right corner of the table so that the pointer becomes an arrow shape , and then drag to increase or decrease the table size. Hold down Shift to maintain the table's height and width proportions.

For a vertical table, use the type tool to position the pointer over the lower left corner of the table so that the pointer becomes an arrow shape  and then drag to increase or decrease the table size.

Note: If the table spans more than one frame in a story, you cannot use the pointer to resize the entire table.

Distribute columns and rows evenly

- 1 Select cells in the columns or rows that should be the same width or height.
- 2 Choose Table > Distribute Rows Evenly or Distribute Columns Evenly.

Change the spacing before or after a table

- 1 Place the insertion point in the table and choose Table > Table Options > Table Setup.
- 2 Under Table Spacing, specify different values for Space Before and Space After, and then click OK.

Note that changing the spacing before the table does not affect the spacing of a table row that falls at the top of a frame.

Break tables across frames

Use Keep options to determine how many rows should remain together, or to specify where a row breaks, such as at the top of a column or frame.

When you create a table that is taller than the frame in which it resides, the frame is *overset*. If you thread the frame to another frame, the table continues in that frame. Rows move into threaded frames one at a time—you can't break a single row across multiple frames. Specify header or footer rows to repeat information in the new frame.

- 1 Position the insertion point in the appropriate row, or select a range of cells in the rows you want to keep together.
- 2 Choose Table > Cell Options > Rows And Columns.
- 3 To keep the selected rows together, select Keep With Next Row.
- 4 To cause the row to break in a specified location, select an option (such as In Next Frame) from the Start Row menu, and then click OK.

 *If you create a single table that spans both pages of a spread, you may want to add a blank column in the middle of the table to create inset margins.*

Add text before a table

A table is anchored to the paragraphs that immediately precede and follow it. If you insert a table at the beginning of the text frame, you can't click above the table to place an insertion point. Instead, use the arrow keys to move the insertion point before the table.

- 1 Place the insertion point at the beginning of the paragraph in the first cell, press the Left Arrow key, and begin typing.
- 2 Do one of the following:
 - Place the insertion point at the beginning of the paragraph in the first cell, press the left arrow key, and begin typing.
 - For vertical tables, place the insertion point at the beginning of the paragraph in the first cell, press the Up Arrow key, and begin typing.

Format text within a table

In general, use the same methods to format text in a table that you would use to format text that's not in a table.

Insert tabs into a table cell

When the insertion point is in a table, pressing Tab moves the insertion point to the next cell. However, you can insert a tab within a table cell. Use the Tabs panel to define tab settings in the table. Tab settings affect the paragraph in which the insertion point is placed.

- 1 Using the Type tool , place the insertion point where you want to insert a tab.
- 2 Choose Type > Insert Special Character > Other > Tab.

To change tab settings, select the columns or cells you want to affect, choose Type > Tabs to display the Tabs panel, and then adjust tab settings.

Note: When you use the Tabs ruler to apply a decimal tab to a cell or group of cells, you usually don't need to press Tab at the beginning of each paragraph to decimal-align the text in the cells. Paragraphs are automatically aligned on the decimal character, unless the paragraph contains additional formatting, such as center alignment, that overrides the decimal tab.

Change the alignment of text within a table cell

- 1 Using the Type tool , select the cell or cells you want to affect.
- 2 Choose Table > Cell Options > Text.
- 3 Under Vertical Justification, select an Align setting: Align Top, Align Center, Align Bottom, or Justify Vertically.

If you select Justify, specify the Paragraph Spacing Limit; this will set a maximum amount of space to be added between paragraphs.

- 4 For First Baseline, select an option to determine how text is to be offset from the top of the cell.

The settings are the same as the corresponding settings in the Text Frame Options dialog box.

- 5 Click OK.

Note: To change the horizontal alignment of text within a cell, use the alignment option in the Paragraph panel. To align text in a cell to a decimal tab, use the Tabs panel to add a decimal tab setting.

Rotate text in a cell

- 1 Position the insertion point in the cell you want to rotate, or select the cells you want to affect.
- 2 Choose Table > Cell Options > Text, or display the Table panel.
- 3 Select a value for Rotation, and click OK.

Change cell inset spacing

- 1 Using the Type tool , place the insertion point in or select the cell or cells you want to affect.
- 2 Choose Table > Cell Options > Text, or display the Table panel.
- 3 Under Cell Insets, specify values for Top, Bottom, Left, and Right, and then click OK.

In many cases, increasing the cell inset spacing will increase the row height. If the row height is set at a fixed value, make sure that you leave enough room for the inset values, to avoid causing overset text.

Merge and split cells

You can merge (combine) or split (divide) cells in a table.

Merge cells

You can combine two or more cells in the same row or column into a single cell. For example, you can merge the cells in the top row of the table to create a single cell to be used for the table title.

- 1 Using the Type tool , select the cells you want to merge.
- 2 Choose Table > Merge Cells.

Unmerge cells

Place the insertion point in the merged cell and choose Table > Unmerge Cells.

Split cells

You can split cells horizontally or vertically, which is especially useful when creating form tables. You can select multiple cells and split them vertically or horizontally.

- 1 Place the insertion point in the cell you want to split, or select a row, column, or block of cells.
- 2 Choose Table > Split Cell Vertically or Split Cell Horizontally.

Work with overset cells

In most cases, a table cell will expand vertically to accommodate new text and graphics being added. However, if you set a fixed row height and add text or graphics that are too large for the cell, a small red dot appears in the lower-right corner of the cell, indicating that the cell is overset.

You cannot flow overset text into another cell. Instead, edit or resize the contents, or expand the cell or the text frame in which the table appears.

In the case of inline graphics or text with fixed leading, it is possible for the cell contents to extend beyond cell edges. You can select the Clip Contents To Cell option, so that any text or inline graphics that otherwise extend beyond any cell edge are clipped to the cell boundary. However, when inline graphics are overset to extend beyond cell bottom edges (Horizontal), this does not apply.

Display the contents of an overset cell

Do one of the following:

- Increase the size of the cell.
- Change the text formatting. To select the cell's contents, click in the overset cell, press Esc, and then use the Control panel to format the text.

Clip an image in a cell

If an image is too large for a cell, it extends beyond the cell borders. You can clip the parts of the image that extend beyond the cell borders.

- 1 Place the insertion point in the cell you want to clip, or select the cell or cells you want to affect.
- 2 Choose Table > Cell Options > Text.
- 3 Select Clip Contents To Cell, and then click OK.

Change the cell writing direction

- 1 Place the text insertion point in the cell for which you want to change direction, or select the cell or cells you want to affect.
- 2 Choose Table > Cell Options > Text.
- 3 Select the type direction in the cell from the Writing Direction menu and click OK.

You can also select the type direction from the Writing Direction pop-up menu in the Table panel, or you can select Cell Direction Runs Against Story Direction in the Text section when creating a cell style.

Selecting and editing tables

Select table cells, rows, and columns

When you select part or all of the text in a cell, that selection has the same appearance as would text selected outside a table. However, if the selection spans more than one cell, the cells and their contents are both selected.

Tables

If a table spans more than one frame, holding the mouse pointer over any header or footer row that is not the first header or footer row causes a lock icon to appear, indicating that you cannot select text or cells in that row. To select cells in a header or footer row, go to the beginning of the table.

Select cells

Using the Type tool , do any of the following:

- To select a single cell, click inside a cell, or select text, and then choose Table > Select > Cell.
- To select multiple cells, drag across a cell border. Be careful not to drag the column or row line so that you don't resize the table.

To switch between selecting all of the text in a cell and selecting the cell, press Esc.

Select entire columns or rows

Using the Type tool , do any of the following:

- Click inside a cell, or select text, and then choose Table > Select > Column or Row.
- Move the pointer over the top edge of a column or the left edge of a row so that the pointer becomes an arrow shape ( or ) , and then click to select the entire column or row.

Address List		
Name	Lee	
	Luebke	
	Sanchez	
	Stewart	
	Rhoades	

Select all header, body, or footer rows

- 1 Click inside a table, or select text.
- 2 Choose Table > Select > Header Rows, Body Rows, or Footer Rows.

Select the entire table

Using the Type tool , do any of the following:

- Click inside a table, or select text, and then choose Table > Select > Table.
- Move the pointer over the upper left corner of the table so that the pointer becomes an arrow shape , and then click to select the entire table.

- Drag the Type tool across the entire table.

You can also select a table in the same way you select an anchored graphic—place the insertion point immediately before or after a table, and then hold down Shift while pressing the Right Arrow key or Left Arrow key, respectively, to select the table.

Insert rows and columns

You can insert rows and columns using a number of different methods.

Insert a row

- 1 Place the insertion point in a row below or above where you want the new row to appear.
- 2 Choose Table > Insert > Row.
- 3 Specify the number of rows you want.
- 4 Specify whether the new row or rows should appear before or after the current row, and then click OK.

The new cells have the same formatting as the text in the row in which the insertion point was placed.

You can also create a new row by pressing Tab when the insertion point is in the last cell.

Insert a column

- 1 Place the insertion point in a column next to where you want the new column to appear.
- 2 Choose Table > Insert > Column.
- 3 Specify the number of columns you want.
- 4 Specify whether the new column or columns should appear before or after the current column, and then click OK.

The new cells have the same formatting as the text in the column in which the insertion point was placed.

Insert multiple rows and columns

- 1 With the insertion point in a cell, choose Table > Table Options > Table Setup.
- 2 Specify a different number of rows and columns, and then click OK.

New rows are added to the bottom of the table; new columns are added to the right side of the table.

You can also change the number of rows and columns using the Table panel. To display the Table panel, choose Window > Type & Tables > Table.

Insert a row or column by dragging

When adding columns, if you drag more than one and one-half times the width of the column being dragged, new columns are added that have the same width as the original column. If you drag to insert only one column, that column can have a narrower or wider width than the column from where you dragged. The same behavior is true of rows, unless the Row Height for the row being dragged is set to At Least. In this case, if you drag to create only one row, InDesign will resize the new row, if necessary, so that it's tall enough to contain text.

- 1 Position the Type tool **T** over the border of a column or row so that a double-arrow icon (↔ or ⇅) appears.
- 2 Hold down the mouse button, and then hold down Alt (Windows) or Option (macOS) while dragging down to create a new row, or to the right to create a new column. (If you press Alt or Option before holding down the mouse button, the Hand tool appears—so make sure you begin dragging before you press Alt or Option.)

Note: Dragging to insert rows or columns doesn't work at the top or left edges of a table. These fields are used to select rows or columns.

Note: Dragging to insert rows or columns doesn't work at the top or left edges of a table in horizontal tables, or at the top or right edges of a table in vertical tables. These fields are used to select rows or columns.

Delete rows, columns, or tables

- To delete a row, column, or table, place the insertion point inside the table, or select text in the table, and then choose Table > Delete > Row, Column, or Table.
- To delete rows and columns by using the Table Options dialog box, choose Table > Table Options > Table Setup. Specify a different number of rows and columns, and then click OK. Rows are deleted from the bottom of the table; columns are deleted from the right side of the table.

Note: In a vertical table, rows are deleted from the left side of the table; columns are deleted from the bottom of the table.

- To delete a row or column by using the mouse, position the pointer over the border of the bottom or right side of the table so that a double-arrow icon (↔ or ⇅) appears; hold down the mouse button; and then hold down Alt (Windows) or Option (macOS) while dragging either up to delete rows, or to the left to delete columns.

Note: If you press Alt or Option before holding down the mouse button, the Hand tool will appear—so press Alt or Option after you begin dragging.

- To delete cell contents without deleting cells, select the cells containing the text you want to delete, or use the Type tool  to select the text within the cells. Press Backspace or Delete, or choose Edit > Clear.

Change the alignment of a table within a frame

A table assumes the width of the paragraph or table cell in which it is created. However, you can change the size of the text frame or table so that the table is wider or narrower than the frame. In such a case, you can decide where you want the table to be aligned within the frame.

- 1 Place the insertion point to the right or left of the table. Make sure that the text insertion point is placed on the table paragraph and not inside the table. The insertion point becomes as tall as the table in the frame.
- 2 Click an alignment button (such as Align Center) in the Paragraph panel or Control panel.

Navigate within a table

Use the Tab or arrow keys to move within a table. You can also jump to a specific row, especially useful in long tables.

Move within a table using Tab

- Press Tab to move to the next cell. If you press Tab in the last table cell, a new row is created.
- Press Shift+Tab to move to the previous cell. If you press Shift+Tab in the first table cell, the insertion point moves to the last table cell.

 *The first cell, last cell, previous cell, and next cell differ depending on the writing direction of the story. For horizontal writing, the first cell is in the upper left corner, the last cell is in the lower right, the previous cell is the cell to the left (the previous cell of a cell on the left edge is the rightmost cell on the row above), and the next cell is the cell to the right (the next cell of a cell on the right edge is the leftmost cell on the row below). For vertical writing, the first cell is in the upper right corner, the last cell is in the lower left, the previous cell is the cell above (the previous cell of a cell on the upper edge is the bottom cell of the row on the right), and the next cell is the cell below (the next cell of a cell on the lower edge is the top cell of the row on the left).*

Move within a table using arrow keys

- 1 Press the arrow keys to navigate within and between table cells. If you press the Right Arrow key when the insertion point is at the end of the last cell in a row, the insertion point moves to the beginning of the first cell in the same row. Similarly, if you press the Down Arrow key when the insertion point is at the end of the last cell in a column, the insertion point moves to the beginning of the first cell in the same column.
- 2 If you press the Down Arrow key when the insertion point is at the end of the last cell in a row in a vertical table, the insertion point moves to the beginning of the first cell in the same row. Similarly, if you press the Left Arrow key when the insertion point is at the end of the last cell in a column in a vertical table, the insertion point moves to the beginning of the first cell in the same column.

Jump to a specific row in a table

- 1 Choose Table > Go To Row.
- 2 Do any of the following:
 - Specify the row number you want to jump to, and then click OK.
 - If a header or footer row is defined in the current table, choose Header or Footer from the menu, and then click OK.

Cut, copy, and paste table contents

When text is selected within a cell, cutting, copying, and pasting actions are the same as for text selected outside a table. You can also cut, copy, and paste cells and their contents. If the insertion point is in a table when you paste, multiple pasted cells appear as a table within a table. You can also move or copy the entire table.

- 1 Select the cells you want to cut or copy, and then choose Edit > Cut or Copy.
- 2 Do any of the following:
 - To embed a table within a table, place the insertion point in the cell where you want the table to appear, and then choose Edit > Paste.
 - To replace existing cells, select one or more cells in the table—making sure that there are sufficient cells below and to the right of the selected cell—and then choose Edit > Paste.

Move or copy a table

- 1 To select the entire table, place the insertion point in the table and choose Table > Select > Table.
- 2 Choose Edit > Cut or Copy, move insertion point where you want the table to appear, and then choose Edit > Paste

Convert tables to text

- 1 Using the Type tool , place the insertion point inside the table, or select text in the table.
- 2 Choose Table > Convert Table To Text.
- 3 For both Column Separator and Row Separator, specify the separators you want to use.
For best results, use a different separator for columns and rows, such as tabs for columns and paragraphs for rows.
- 4 Click OK.

When you convert a table to text, the table lines are removed and the separator you specify is inserted at the end of each row and column.

Combine tables

Use the Paste command to merge two or more tables into a single table.

- 1 In the target table, insert at least as many blank rows as you'll be pasting from the other tables. (If you insert fewer rows than are copied, you cannot paste.)
- 2 In the source table, select the cells you want to copy. (If you copy more column cells than are available in the target table, you cannot paste.)
- 3 Select at least one cell where you want the incoming rows to be inserted, and then choose Edit > Paste.

 If the pasted rows use different formatting than the rest of the table, define one or more cell styles, and then apply those cell styles to the pasted cells. Hold down Alt (Windows) or Option (macOS) while clicking the cell style to override existing formatting.

Working with tables in Story Editor

When you choose Edit > Edit In Story Editor, tables and their contents appear in Story Editor. You can edit tables in Story Editor.

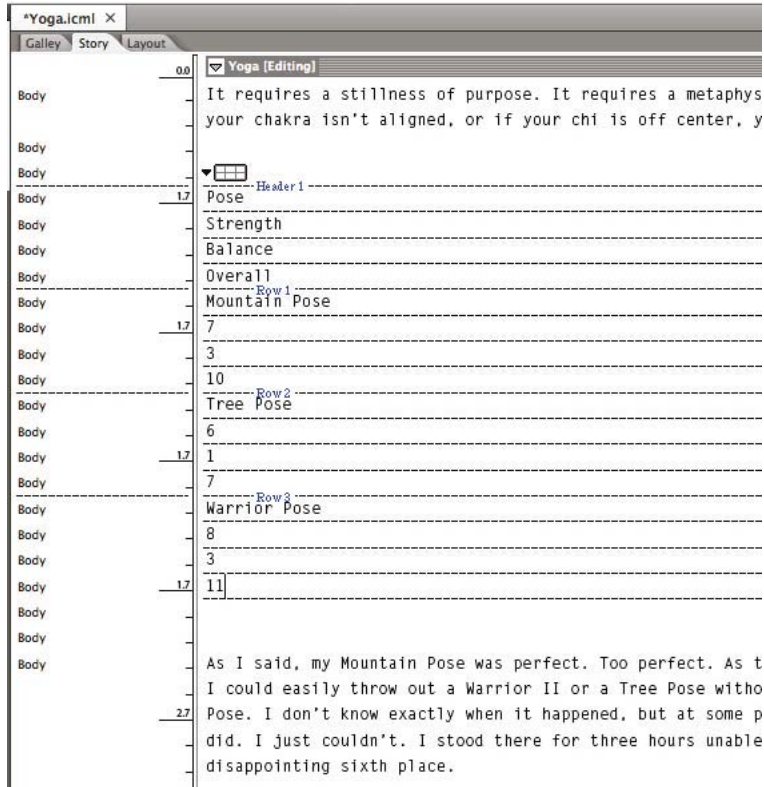

A Table icon B Overset graphic

- To expand or collapse the table in Story Editor, click the triangle to the left of the table icon at the top of the table.
- To determine whether the table is sorted by rows or columns, right-click (Windows) or Ctrl-click (macOS) the table icon and choose Arrange By Rows or Arrange By Columns.
- Use Layout view to modify and format the table. You cannot select columns or rows in Story Editor.

Tables

Working with tables in Galley/Story view

When you're working in Galley or Story view, you can edit tables and their contents.

- To expand or collapse the table in Galley or Story view, click the triangle to the left of table icon at top of table.
- To determine whether the table is sorted by rows or columns, right-click (Windows) or Ctrl-click (macOS) the table icon and choose Arrange By Rows or Arrange By Columns.
- Use Layout view to modify and format the table. You cannot select columns or rows in Galley or Story view.

Table and cell styles

About table and cell styles

Just as you use text styles to format text, you can use table and cell styles to format tables. A *table style* is a collection of table formatting attributes, such as table borders and row and column strokes, that can be applied in a single step. A *cell style* includes formatting such as cell insets, paragraph styles, and strokes and fills. When you edit a style, all tables or cells to which the style is applied are updated automatically.

Note: There is one important difference between text styles and table styles. While all character styles attributes can be part of a paragraph style, cell style attributes are not part of the table style. For example, you cannot use a table style to change the border color of interior cells. Instead, create a cell style and include it in the table style.

[Basic Table] and [None] styles

By default, each new document contains a [Basic Table] style that can be applied to tables you create and a [None] style that can be used to remove cell styles applied to cells. You can edit the [Basic Table] style, but you can't rename or delete either [Basic Table] or [None].

Using cell styles in table styles

When you create a table style, you can specify which cell styles are applied to different regions of the table: header and footer rows, left and right columns, and body rows. For example, for the header row, you can assign a cell style that applies a paragraph style, and for the left and right columns, you can assign different cell styles that apply shaded backgrounds.

Name	Region and City	Member Since
Lee	East, Taipei	June 1999
Luebke	East, Augsburg	November 2003
Sanchez	South, Fort Morrison	August 1998
Stewart	North, Suddan	May 2001
Rhoades	West, Tucson	March 2004

A Header row formatted with cell style that includes paragraph style B Left column C Body cells D Right column

Cell style attributes

Cell styles do not necessarily include all the formatting attributes of a selected cell. When you create a cell style, you can determine which attributes are included. That way, applying the cell style changes only the desired attributes, such as cell fill color, and ignores all other cell attributes.

Formatting precedence in styles

If a conflict occurs in formatting applied to a table cell, the following order of precedence determines formatting:

Cell style precedence 1. Header/Footer 2. Left column/Right column 3. Body rows. For example, if a cell appears in both the header and the left column, the formatting from the header cell style is used.

Table style precedence 1. Cell overrides 2. Cell style 3. Cell styles applied from a table style 4. Table overrides 5. Table styles. For example, if you apply one fill using the Cell Options dialog box and another fill using the cell style, the fill from the Cell Options dialog box is used.

Table/Cell Styles panels overview

Use the Table Styles panel (Window > Styles > Table Styles) to create and name table styles, and to apply the styles to existing tables or tables you create or import. Use the Cell Styles panel (Window > Styles > Cell Styles) to create and name cell styles, and to apply the styles to table cells. Styles are saved with a document and appear in the panel each time you open that document. You can save table and cell styles in groups for easier management.

When you position the insertion point in a cell or table, any style that is applied is highlighted in either of the panels. The name of any cell style that is applied through a table style appears in the lower left corner of the Cell Styles area. If you select a range of cells that contains multiple styles, no style is highlighted and the Cell Styles panel displays “(Mixed).”

Open the Table Styles or Cell Styles panel

Choose Window > Styles, and choose Table Styles or Cell Styles.

Change how styles are listed in the panel

- Select Small Panel Rows to display a condensed version of the styles.
- Drag the style to a different position. You can also drag styles to groups that you create.
- Choose Sort By Name from the panel menu to list the styles alphabetically.

Define table and cell styles

If you work with a standalone story, you can define, modify, and apply table and cell styles in InCopy. If the styles you want exist in another InCopy document, you can import those styles into the current document. You cannot import table or cell styles from an InDesign document.

- 1 If you want to base a new style on the formatting of an existing table or cell, place the insertion point in a cell.
- 2 If desired, define a paragraph style for the cell style.
- 3 Choose Window > Styles > Table Styles to open the Table Style panel, or choose Window > Styles > Cell Styles to open the Cell Styles panel.
- 4 Choose New Table Style from the Table Styles panel menu, or choose New Cell Style from the Cell Styles panel menu.
- 5 For Style Name, type a name.
- 6 For Based On, select which style the current style is based on.
- 7 To define a style shortcut, position the insertion point in the Shortcut text box and make sure that Num Lock is on. Then hold down any combination of Shift, Alt, or Ctrl (Windows) or Shift, Option, and Command (macOS), and press a number on the numeric keypad. You cannot use letters or non-keypad numbers for defining style shortcuts.
- 8 To specify the formatting attributes, click a category on the left and specify the attributes you want. For example, to assign a paragraph style to a cell style, click the General category, and then choose the paragraph style from the Paragraph Style menu.

For cell styles, options that don't have a setting specified are ignored in the style. If you don't want a setting to be part of the style, choose (Ignore) from the setting's menu, delete the contents of the field, or click a check box until a small box appears in Windows or a hyphen (-) appears in macOS.

- 9 If you want the new style to appear in a style group you've created, drag it to the style group folder.

Load (import) table styles from other documents

You can import table and cell styles from another InDesign document into the active document. During import, you can determine which styles are loaded and what should occur if a loaded style has the same name as a style in the current document. You can also import styles from an InCopy document.

You can import table and cell styles from an InDesign or InCopy document into a standalone InCopy document or InCopy content that is linked to InDesign. You can determine which styles are loaded, and what should occur if a loaded style has the same name as a style in the current document.

Note: *If you import styles into linked content, new styles are added to the InDesign document when the content is updated, and any style with a name conflict is overridden by the InDesign style with the same name.*

- 1 From the menu of the Cell Styles or Table Styles panel, choose Load Cell Styles, Load Table Styles, or Load Table And Cell Styles.
- 2 Double-click the InDesign document containing the styles you want to import.
- 3 In the Load Styles dialog box, make sure that a check mark appears next to the styles you want to import. If any existing style has the same name as one of the imported styles, choose one of the following options under Conflict With Existing Style, and then click OK:

Use Incoming Style Definition Overwrites the existing style with the loaded style and applies its new attributes to all cells in the current document that used the old style. The definitions of the incoming and existing styles appear at the bottom of the Load Styles dialog box so you can compare them.

Auto-Rename Renames the loaded style. For example, if both documents have a style named “Table Style 1,” the loaded style is renamed “Table Style 1 copy” in the current document.

Apply table and cell styles

Unlike paragraph and character styles, table and cell styles do not share attributes, so applying a table style does not override cell formatting, and applying a cell style does not override table formatting. By default, applying a cell style removes formatting applied by any previous cell style, but does not remove local cell formatting. Similarly, applying a table style removes formatting applied by any previous table style, but does not remove overrides made using the Table Options dialog box.

In the Styles panel, a plus sign (+) appears next to the current cell or table style if the selected cell or table has additional formatting that isn't part of the applied style. Such additional formatting is called an *override*.

- 1 Position the insertion point in a table, or select the cells to which you want to apply the style.
- 2 Do one of the following:
 - Click the table or cell style in the Table Styles or Cell Styles panel (choose Window > Styles > Table Styles or Cell Styles). If the style is in a style group, expand the style group to locate the style.
 - Press the shortcut you defined for the style. (Make sure that Num Lock is on.)

Base one table or cell style on another

You can create links between similar table or cell styles by creating a base, or *parent*, style. When you edit the parent style, any changed attribute that appears in the *child* styles will change as well. By default, table styles are based on [No Table Style], and cell styles are based on [None].

- 1 Create a new style.
- 2 In the New Table Style or New Cell Style dialog box, select the parent style in the Based On menu. The new style becomes the child style.

- 3 Specify formatting for the new style to distinguish it from the parent style.

Edit table and cell styles

One of the advantages of using styles is that when you change the definition of a style, all of the tables or cells formatted with that style change to match the new style definition.

Note: *If you edit styles in InCopy content that's linked to an InDesign document, the modifications are overridden when the linked content is updated.*

- 1 Do one of the following:
 - If you don't want the style to be applied to a selected table or cell, right-click (Windows) or Control-click (Mac OS) the style in the Styles panel, and choose Edit [style name].
 - In the Styles panel, double-click the style, or select the style and choose Style Options from the Styles panel menu. Note that this method applies the cell style to any selected cell or the table style to any selected table. If no table is selected, double-clicking a table style sets it as the default style for any table you create.
- 2 Adjust settings in the dialog box, and then click OK.

Delete table and cell styles

When you delete a style, you can select a different style to replace it, and you can choose whether to preserve the formatting.

- 1 Select the style in the Styles panel.
- 2 Do one of the following:
 - Choose Delete Style from the panel menu.
 - Click the Delete icon  at the bottom of the panel, or drag the style to the Delete icon.
 - Right-click (Windows) or Control-click (macOS) the style, and then choose Delete Style. This method is especially useful for deleting a style without applying it to the selected cell or table.
- 3 Select the style to replace it.

If you select [No Table Style] to replace a table style or [None] to replace a cell style, select Preserve Formatting to keep the formatting of the table or cell to which the style is applied. The table or cell preserves its formatting but is no longer associated with a style.

- 4 Click OK.

Redefine table or cell styles based on current formatting

After you apply a style, you can override any of its settings. If you decide you like the changes, you can redefine the style to retain the new formatting.

Note: *If you redefine styles in InCopy content linked to an InDesign document, the modifications are overridden when the linked content is updated.*

- 1 Place the insertion point in the table or cell that is formatted with the style you want to redefine.
- 2 Make changes to the table or cell as necessary.
- 3 Choose Redefine Style from the Styles panel menu.

Note: For cell styles, changes to only those attributes that are part of the cell style will enable the Redefine Style command. For example, if the cell style includes a red fill and you override a cell to use a blue fill, you can redefine the style based on that cell. But if you change an attribute that is ignored in the cell style, you can't redefine the style with that attribute.

Override table and cell styles

After you apply a table or cell style, you can override any of its settings. To override a table style, you can change options in the Table Options dialog box. To override a cell, you can change options in the Cell Options dialog box or use other panels to change the stroke or fill. If you select a table or cell that has an override, a plus sign (+) appears next to the style in the Styles panel.

You can clear table and cell overrides when you apply a style. You can also clear overrides from a table or cell to which a style has already been applied.

If a style has a plus sign (+) next to it, hover over the style to view a description of the override attributes.

Preserve or remove overrides while applying a table style

- To apply a table style and preserve cell styles but remove overrides, hold down Alt (Windows) or Option (macOS) as you click the style in the Table Styles panel.
- To apply a table style and remove both cell styles and overrides, hold down Alt+Shift (Windows) or Option+Shift (macOS) as you click the style in the Table Styles panel.

Right-click (Windows) or Control-click (macOS) the style in the Table Styles panel, and then choose Apply [table style], Clear Cell Styles to apply a style and clear cell styles.

Remove overrides while applying a cell style

To apply a cell style and remove overrides, hold down Alt (Windows) or Option (macOS) as you click the name of the style in the Cell Styles panel.

Note: Only those attributes that are part of the cell style are considered overrides. For example, if the cell style includes a red fill and all other attributes are ignored, changing a different cell option is not considered an override.

Clear attributes not defined by a cell style

Choose Clear Attributes Not Defined By Style from the Cell Styles panel menu.

Clear table or cell overrides

- 1 Select the table or cells containing the overrides.
- 2 In the Styles panel, click the Clear Overrides In Selection icon , or choose Clear Overrides from the Styles panel menu.

Break the link to table or cell styles

When you break the link between tables or cells and the style applied to them, the tables or cells retain their current formatting. However, future changes to that style won't affect them.

- 1 Select the cells to which the style has been applied.
- 2 Choose Break Link To Style from the Styles panel menu.

Table strokes and fills

About table strokes and fills

You can add strokes and fills to your tables in a number of ways. Use the Table Options dialog box to change the stroke of the table border, and to add alternating strokes and fills to columns and rows. To change the strokes and fills of individual cells or header/footer cells, use the Cell Options dialog box, or use the Swatches, Stroke, and Color panels.

By default, the formatting you select using the Table Options dialog box overrides any corresponding formatting previously applied to table cells. However, if you select the Preserve Local Formatting option in the Table Options dialog box, the strokes and fills applied to individual cells are not overridden.

If you use the same formatting repeatedly for tables or cells, create and apply table styles or cell styles.

Change the table border

You can change the table border by using either the Table Setup dialog box or the Stroke panel.

- 1 With the insertion point in a cell, choose Table > Table Options > Table Setup.
- 2 Under Table Border, specify the desired weight, type, color, tint, and gap settings.
- 3 Under Stroke Drawing Order, select the drawing order from the following options:
 - Best Joins** If selected, row strokes will appear to the front at the points where strokes of different colors cross. In addition, when strokes such as double lines cross, the strokes are joined and the crossing points are connected.
 - Row Strokes In Front** If selected, row strokes appear in front.
 - Column Strokes In Front** If selected, column strokes appear in front.
 - InDesign 2.0 Compatibility** If selected, row strokes appear in front. In addition, when strokes such as double lines cross, they are joined and the crossing points are connected only at points where strokes cross in a T-shape.
- 4 If you do not want stroke formatting of individual cells to be overridden, select Preserve Local Formatting.
- 5 Click OK.

 *If you remove the stroke and fill from a table, choose View > Extras > Show Frame Edges to display the cell boundaries of a table.*

Add stroke and fill to cells

You can add stroke and fill to cells using the Cell Options dialog box, Stroke panel, or Swatches panel.

Add stroke and fill using Cell Options

You can determine which cell lines are formatted with a stroke or fill by selecting or deselecting lines in the Preview proxy. If you want to change the appearance of all rows or columns in the table, use an alternating stroke or fill pattern in which the second pattern is set to 0.

- 1 Using the Type tool **T**, place the insertion point in or select the cell or cells in which you want to add a stroke or fill. To add a stroke or fill to header/footer rows, select the header/footer cells at the beginning of the table.
- 2 Choose Table > Cell Options > Strokes And Fills.
- 3 In the proxy preview area, specify which lines will be affected by stroke changes. For example, if you want to add a heavy stroke to the outside lines but not to the inside lines of the selected cells, click an inside line to deselect it. (Selected lines are blue; deselected lines are gray.)

In the proxy preview area, double-click any outside line to select the entire outer selection rectangle. Double-click any inside line to select the inside lines. Triple-click anywhere in the proxy to select or deselect all lines.

- 4 For Cell Stroke, specify desired weight, type, color, tint, and gap settings.
- 5 For Cell Fill, specify desired color and tint settings.
- 6 Select Overprint Stroke and Overprint Fill if desired, and then click OK.

Add a stroke to cells using the Stroke panel

The Stroke panel is available in InDesign, not InCopy.

- 1 Select the cell or cells you want to affect. To apply a stroke to header or footer cells, select the header or footer row.
- 2 Choose Window > Stroke to display the Stroke panel.
- 3 In the proxy preview area, specify which lines will be affected by stroke changes.
- 4 In the Tools panel, make sure the Object button  is selected. (If the Text button **T** is selected, the stroke changes will affect the text, not the cells.)
- 5 Specify a weight value and stroke type.

Add a fill to cells using the Swatches panel

- 1 Select the cell or cells you want to affect. To apply a fill to header or footer cells, select the header or footer row.
- 2 Choose Window > Color > Swatches to display the Swatches panel.
- 3 Make sure the Object button  is selected. (If Text button **T** is selected, the color changes will affect text, not cells.)
- 4 Select a swatch.

Add a gradient to cells using the Gradient panel

- 1 Select the cells you want to affect. To apply a gradient to header or footer cells, select the header or footer row.
- 2 Choose Window > Color > Gradient to display the Gradient panel.

Tables

- Click in the Gradient Ramp to apply a gradient to the selected cells. Adjust the gradient settings as necessary.

Add diagonal lines to a cell

- Using the Type tool , place the insertion point in or select the cell or cells in which you want to add diagonal lines.
- Choose Table > Cell Options > Diagonal Lines.
- Click the button for the type of diagonal line you want to add.
- Under Line Stroke, specify desired weight, type, color, and gap settings; specify a Tint percentage and Overprint options.
- From the Draw menu, choose Diagonal In Front to place the diagonal line in front of the cell contents; choose Content In Front to place the diagonal line behind the cell contents, and then click OK.

Table stroke and fill options

When selecting strokes and fills for the table or cells, use the following options:

Weight Specifies the line thickness for the table or cell border.

Type Specifies the line style, such as Thick - Thin.

Color Specifies the color of the table or cell border. The choices listed are those available in the Swatches panel.

Tint Specifies the percentage of ink of the specified color to be applied to the stroke or fill.

Gap Color Applies a color to the areas between the dashes, dots, or lines. This option is not available if Solid is selected for Type.

Gap Tint Applies tint to the areas between the dashes, dots, or lines. This option is not available if Solid is selected for Type.

Overprint When selected, causes the ink specified in the Color drop-down list to be applied over any underlying colors, rather than knocking out those inks.

Alternate strokes and fills in a table

You can alternate strokes and fills to enhance readability or improve the appearance of your table. Alternating strokes and fills in table rows does not affect header and footer rows. However, alternating strokes and fills in columns does affect header and footer rows.

Alternating stroke and fill settings override cell stroke formatting, unless you select the Preserve Local Formatting option in the Table Options dialog box.

 *If you want to apply a fill or stroke to every body cell in the table, and not just alternating patterns, you can still use the alternating stroke and fill settings to create such non-alternating patterns. To create such an effect, specify 0 for Next in the second pattern.*

Rhoades		West, Tucson

Add alternating strokes to a table

- 1 With the insertion point in a cell, choose Table > Table Options > Alternating Row Strokes or Alternating Column Strokes.
- 2 For Alternating Pattern, select the type of pattern you want to use. Select Custom if you want to specify a pattern; for example, one column with a thick black line followed by three columns with thin yellow lines.
- 3 Under Alternating, specify the fill options for both the first pattern and the next pattern. For example, you may want to add a solid stroke to the first column and a Thick - Thin line to the next column, so that they alternate. Specify 0 for Next if you want the strokes to affect every row or column.

Note: In tables that span multiple frames, alternating strokes and fills for rows do not restart at the beginning of additional frames in the story.

- 4 Select Preserve Local Formatting if you want formatted strokes previously applied to the table to remain in effect.
- 5 For Skip First and Skip Last, specify the number of rows or columns at the beginning and end of the table in which you do not want stroke attributes to appear, and then click OK.

Add alternating fills to a table

- 1 With the insertion point in a cell, choose Table > Table Options > Alternating Fills.
- 2 For Alternating Pattern, select the type of pattern you want to use. Select Custom if you want to specify a pattern, such as one row shaded in gray followed by three rows shaded in yellow.
- 3 Under Alternating, specify the fill options for both the first pattern and the subsequent pattern. For example, if you selected Every Second Column for Alternating Pattern, you may want to shade the first two columns in a gray tint and leave the next two columns blank. Specify 0 for Next if you want the fill to apply to every row.
- 4 Select Preserve Local Formatting if you want previously formatted fills applied to the table to remain in effect.
- 5 For Skip First and Skip Last, specify the number of rows or columns at the beginning and end of the table in which you do not want fill attributes to appear, and then click OK.

Turn off alternating strokes and fills in a table

- 1 Place the insertion point in the table.
- 2 Choose Table > Table Options > Alternating Row Strokes, Alternating Column Strokes, or Alternating Fills.
- 3 For Alternating Pattern, choose None, and then click OK.

Creating tables

A table consists of rows and columns of cells. A cell is like a text frame in which you can add text, anchored frames, or other tables. Create tables in Adobe InDesign or export them from other applications.

Note: To create, edit, and format tables in Adobe InCopy, make sure you are in Layout view.

Create tables

A table consists of rows and columns of cells. A cell is like a text frame in which you can add text, inline graphics, or other tables. You can create tables from scratch or by converting them from existing text. You can also embed a table within a table.

When you create a table, the new table fills the width of the container text frame. A table is inserted on the same line when the insertion point is at the beginning of the line, or on the next line, when the insertion point is in the middle of a line.

Tables flow with surrounding text just as inline graphics do. For example, a table moves through threaded frames when the text above it changes in point size or when text is added or deleted. However, a table cannot appear on a text-on-path frame.

You can create vertical tables the same way you create horizontal ones. The writing direction of a table depends on that of the text frame used to create the table, and the writing direction of the table changes when that of the text frame is changed. This behavior is the same when you create a table within a frame grid. However, the writing direction for cells within a table can be changed, irrespective of the writing direction of the table.

Confirm the writing direction of the text frame before creating a table.

Create a table from scratch

The table you create fills the width of the text frame.

- 1 Using the Type tool **T**, place the insertion point where you want the table to appear.
- 2 Choose Table > Insert Table.
- 3 Specify the numbers of rows and columns.
- 4 Specify the number of horizontal cells in the body row and the number of vertical cells in the Column.
- 5 If your table contents will continue on more than one column or frame, specify the number of header or footer rows in which you want the information to be repeated.
- 6 (Optional) Specify a table style.
- 7 Click OK.

The row height of a table is determined by the specified table style. For example, a table style may use cell styles to format different parts of the table. If any of these cell styles include paragraph styles, the leading value of the paragraph styles determines the row height of that area. If no paragraph style is used, the document's default slug determines the row height. (The slug is based on the leading value. In this context, a *slug* is the approximate height of the highlighting in selected text.)

Create a table from existing text

Before you convert text to a table, make sure that you set up the text properly.

- 1 To prepare the text for conversion, insert tabs, commas, paragraph returns, or another character to separate columns. Insert tabs, commas, paragraph returns, or another character to separate rows. (In many instances, text can be converted to a table without having to be edited.)

Tables

- 2 Using the Type tool , select the text you want to convert to a table.
- 3 Choose Table > Convert Text To Table.
- 4 For both Column Separator and Row Separator, indicate where new rows and columns should begin. Choose Tab, Comma, or Paragraph, or type the character, such as a semicolon (;), in the Column Separator and Row Separator field. (Any character you type appears in the menu the next time you create a table from text.)
- 5 If you specify the same separator for columns and rows, indicate the number of columns you want the table to include.
- 6 (Optional) Specify a table style to format the table.
- 7 Click OK.

If any row has fewer items than the number of columns in a table, empty cells fill out the row.

Embed a table within a table

- 1 Do one of the following:
 - Select the cells or table you want to embed, and then choose Edit > Cut or Copy. Place the insertion point in the cell where you want the table to appear, and then choose Edit > Paste.
 - Click inside a cell, choose Table > Insert Table, specify the number of rows and columns, and then click OK.
- 2 Adjust the cell inset as necessary.

If you create a table within a cell, you cannot use the mouse to select any part of the table that oversets the cell boundary. Instead, expand the row or column; or place the insertion point in the first part of the table, and use keyboard shortcuts to move the insertion point and select text.

Importing tables from other applications

When you use the Place command to import a Microsoft Word document that includes tables, or a Microsoft Excel spreadsheet, imported data is an editable table. You can use the Import Options dialog box to control the formatting.

You can also paste data from an Excel spreadsheet or a Word table into an InDesign or InCopy document. The Clipboard Handling preference settings determine how text pasted from another application is formatted. If Text Only is selected, the information appears as unformatted tabbed text, which you can then convert to a table. If All Information is selected, the pasted text appears in a formatted table.

If you're pasting text from another application into an existing table, insert enough rows and columns to accommodate the pasted text, select the Text Only option in Clipboard Handling preferences, and make sure that at least one cell is selected (unless you want to embed the pasted table into a cell).

If you want more control over formatting the imported table, or if you want to maintain spreadsheet formatting, use the Place command to import the table. If you want to maintain a link to the spreadsheet, select the Create Links When Placing Text And Spreadsheet Files option in File Handling preference settings.

 You can also copy and paste tabbed text across a selection of table cells. This technique is a great way to replace content while preserving formatting. For example, suppose you want to update the content of a formatting table in a monthly magazine. One possibility is to link to an Excel spreadsheet. However, if your content comes from a different source, you can copy the tabbed text containing the new content, select the range of cells in the formatted InDesign table, and paste.

Add text to a table

You can add text, anchored objects, XML tags, and other tables to table cells. The height of a table row expands to accommodate additional lines of text, unless you set a fixed row height. You cannot add footnotes to tables.

Using the Type tool , do any of the following:

- Position the insertion point in a cell, and type text. Press Enter or Return to create a new paragraph in the same cell. Press Tab to move forward through cells (pressing Tab in the last cell inserts a new row). Press Shift+Tab to move backwards through cells.
- Copy text, position the insertion point in a cell, and then choose Edit > Paste.
- Position insertion point in a cell where you want to add text, choose File > Place, and double-click a text file.

Add graphics to a table

To add a graphic to a table in a standalone InCopy document, make sure that you're in Layout view. To add a graphic to a table in a linked InDesign document, use InDesign so that you have more control over resizing the text frame.

Do any of the following:

- Position the insertion point where you want the graphic, choose File > Place, and then double-click the graphic's filename.
- Position the insertion point where you want the graphic, choose Object > Anchored Object > Insert, and then specify settings. You can later add a graphic to the anchored object.
- Copy a graphic or a frame, position the insertion point, and then choose Edit > Paste.

When you add a graphic that is larger than the cell, the cell height expands to accommodate the graphic, but the width of the cell doesn't change—the graphic may extend beyond the right side of the cell. If the row in which the graphic is placed is set to a fixed height, a graphic that is taller than the row height causes the cell to be *overset*.

 To avoid an overset cell, you may want to place the image outside the table, resize the image, and then paste it into the table cell.

Add table headers and footers

When you create a long table, the table may span more than one column, frame, or page. You can use headers or footers to repeat the information at the top or bottom of each divided portion of the table.

You can add header and footer rows when you create the table. You can also use the Table Options dialog box to add header and footer rows and change how they appear in the table. You can convert body rows to header or footer rows.

Address List	
Name	Region and City
Lee	East, Taipei
Luebbe	East, Augsburg
Sanchez	South, Fortaleza
Stewart	North, Sudbury

Address List	
Name	Region and City
Rhoades	West, Tucson
Lautoka	North, Suva
Rakiraki	Surrey
Coburg	South, Wilamette

 To number tables sequentially, such as Table 1A, Table 1B, and so on, add a variable to the table header or footer.

Convert existing rows to header or footer rows

- 1 Select the rows at the top of the table to create header rows, or at the bottom of the table to create footer rows.
- 2 Choose Table > Convert Rows > To Header or To Footer.

Change header or footer row options

- 1 Place the insertion point in the table, and then choose Table > Table Options > Headers And Footers.
- 2 Specify the number of header or footer rows. Blank rows may be added to the top or bottom of the table.
- 3 Specify whether the information in the header or footer appears in every text column (if text frames have more than one column), once per frame, or only once per page.
- 4 Select Skip First if you don't want the header information to appear in the first row of the table. Select Skip Last if you don't want the footer information to appear in the last row of the table.

The Skip First option is especially useful if you want to indicate that the header or footer is continued. For example, for a table that spans multiple pages, you may want the header text to be "Table 2 (Continued)." Since you don't want "(Continued)" to appear at the beginning of the table, select Skip First, and simply type Table 2 in the first row of the table.

- 5 Click OK.

Remove header or footer rows

Do any of the following:

- Place the insertion point in the header or footer row, and then choose Table > Convert Rows > To Body.
- Choose Table > Table Options > Headers And Footers, and then specify a different number of header rows or footer rows.

Chapter 9: Printing

Setting up a printer

Typically, the final printing process is done in Adobe® InDesign®, but you can use Adobe InCopy® to print drafts of your stories in Galley, Story, or Layout view.

Printing with InCopy

InCopy typically links with an InDesign master document. The InDesign document is usually the ultimate source for the final printing process, so many of the controls needed for production-quality printing are reserved for InDesign. However, you can use InCopy to print drafts of your stories in either Galley, Story, or Layout view. The printed copy looks similar to the document on the screen, depending on the view and print settings:

- In the Galley or Story view, InCopy prints unformatted text in a continuous column (or columns). You do not see the document layout and formatting features.
- In the Layout view, InCopy prints the document as it appears on the screen, with frames and all other page elements intact.

InCopy works with both Adobe PostScript® and non-PostScript printers, as well as other kinds of printing devices. If you are using a PostScript printer, make sure that you have the printer driver with the correct, properly installed PostScript Printer Description (PPD) file.

Note: *InCopy does not support the format used by PDF Writer. If you attempt to print to PDF Writer, you will experience delays or errors in printing.*

About printer drivers

A printer driver lets you directly access printer features from applications on your computer. Having the correct driver ensures that you have access to all of the features a particular printer supports.

Adobe recommends using the latest printer drivers, which are listed in the following table. If you encounter problems with an older driver, upgrade to the latest driver for your operating system.

Operating system	Printer driver
Windows	Psript 5 (system driver)
macOS 10.2 (or later)	Built-in PS Driver for macOS

For more information on recommended and supported PostScript printer drivers, including installation instructions, search the section on printer drivers on the Adobe website.

Some InCopy printing features appear in both the Print dialog box of InCopy and the printer driver dialog boxes. In general, you should set options for such overlapping features only in the InCopy Print dialog box; InCopy ignores duplicate settings specified in the printer driver dialog box. The instructions in this section can help you work with the overlapping options.

Printing

Printer drivers may support features that are not included in InCopy, such as duplex printing. Support for these features varies depending on the printer driver you have. Check with your printer manufacturer for details.

If you want to specify settings for a specific printer, InCopy provides access to the printer driver through the Setup button in the InCopy Print dialog box. In Windows, this button opens the Properties dialog box for the currently selected printer. In macOS, this button displays the standard macOS Print dialog box.

Select a PPD file

A *PPD file* (PostScript Printer Description file) customizes the behavior of the driver for your specific PostScript printer. It contains information about the output device, including printer-resident fonts, available media sizes and orientation, optimized screen frequencies, screen angles, resolution, and color output capabilities. It's important to set up the correct PPD before you print. Selecting the PPD that corresponds to your PostScript printer or imagesetter populates the Print dialog box with the available settings for the output device. You can switch to a different one to suit your needs. Applications use the information in the PPD file to determine which PostScript information to send to the printer when printing a document.

For best printing results, Adobe recommends that you obtain the latest version of the PPD file for your output device from the manufacturer. Many print service providers and commercial printers have PPDs for the imagesetters they use. Be sure to store PPDs in the location specified by the operating system. For details, consult the documentation for your operating system.

In Windows and in macOS, you select a PPD file in the same way you add a printer. The steps for selecting a PPD file are different for each platform. See your operating system documentation for details.

Printing stories

Print the Galley or Story view

When you print the Galley or Story view, InCopy prints unformatted text in a continuous column (or columns), without layout and formatting features. Printing in Galley or Story view gives you a hard copy that resembles galleys in traditional publishing. The galley format makes it easy to concentrate on the textual content of a story, and to see the changes made by you and other contributors.

- 1 Choose File > Print.
- 2 Choose Galley & Story from the View option in the Print dialog box.
- 3 In the Print dialog box, specify the following options:
 - Type the number of copies to print.
 - Select the paper size from the list.
 - Choose the paper orientation.
 - Choose whether to print All stories, Current Story, or All Expanded.

Note: The All Expanded option is active only when you are working with linked InCopy files.

Printing

- 4 In the Options section, specify whether you want to Use Current Galley Settings or Override Current Galley Settings. If you choose Override Current Galley Settings, select which information you want to print.
- 5 To include the document name, number of pages, and print time on the printed page, select Print Page Information.
- 6 For a summary of information related to the story, select Print Story Information. This prints the information contained in the Content File Info dialog box.
- 7 Click Print.

Note: If your document does not print correctly, make sure that the correct printer driver is installed.

Print the Layout view

When you print the Layout view, InCopy prints the document as it appears on the screen, with frames and all other page elements intact.

Note: Because InCopy is not designed for production-quality printing, it does not include controls for trapping, printer's marks, color separations, and certain graphics-related printing functions. InCopy handles only composite printing.

- 1 Choose File > Print.
- 2 Select Layout from the View options in the Print dialog box.
- 3 Specify the following options:
 - Type the number of copies to print.
 - Select the paper size from the list.
 - Choose the paper orientation.
 - Choose to print all stories or specify the range of pages to print in the Current story.
- 4 Choose whether or not you want to scale the document.
- 5 To print the images included in the document, select Print Images.
- 6 To print facing pages on the same sheet, select Print Spreads.
- 7 To include the document name, number of pages, and print time on the printed page, select Print Page Information.
- 8 Click Print.

Note: If your document does not print correctly, make sure that the correct print driver is installed.

Create a standard PostScript file

As an alternative to printing a document to a printer, you can save an Adobe PostScript® language description of the document as a file for printing on remote printers. A standard PostScript (.ps) file contains a description of everything in your document, including info about linked files and instructions tailored to the currently selected output device.

A PostScript file is usually larger than the original InCopy document. Once you create the PostScript file, you can copy it to a disk or other removable storage device, or send it to another computer for printing.

Note: Be sure to save the PostScript file to your hard drive before transferring the file to a network drive or removable media. The slower access time between the hard drive and other drives can cause file corruption or loss of data, and might damage your document.

- 1 Choose File > Print.
- 2 Click Setup.

Printing

- 3 Depending on your operating system, do one of the following:
 - (Windows) Select Print To File. Click Print.
 - (macOS) From the PDF menu, choose Save PDF As PostScript. Enter a name and location for the file when prompted, and click Save.
- 4 Change the existing settings in the InCopy Print dialog box, if necessary. InCopy uses the current page range when creating the PostScript file.
- 5 Click Print.
- 6 (Windows) Enter a name and location for the file, and click Save.

Change the default print setting

You can save print settings with the application, so that new InCopy documents use the same print settings. In macOS, these print settings also become the default for the printer. You can override individual print settings.

- 1 Choose File > Print, and adjust the default print settings as desired.
- 2 Click Save Settings.

Any subsequent overrides to these saved settings are discarded at the completion of the print job.

Scale documents

When you print from Layout view, you can control how your document pages fit on the chosen paper size by scaling. The maximum page size you can print from a Windows system is 129 by 129 inches. To fit an oversized document on a smaller piece of paper, you can scale the document width and height either symmetrically or asymmetrically. You can also automatically scale the pages to fit the imageable area of the current paper size. Scaling does not affect the size of the pages in the document.

Scale a document manually

- 1 In Layout view, choose File > Print.
- 2 To maintain the current document proportions of width to height, select Constrain Proportions. To scale the document asymmetrically, make sure this option is deselected.
- 3 Type percentages from 1 to 1000 in the Width and Height boxes. If you selected Constrain Proportions, you need to enter only one value; the other is updated automatically.
- 4 Click Print.

Scale a document automatically

- 1 In Layout view, choose File > Print.
- 2 Select Scale To Fit. The scaling percentage, which is determined by the imageable area defined by the selected PPD, appears next to the Scale To Fit option.
- 3 Click Print.

Chapter 10: PDF

Understanding Adobe PDF

About Adobe PDF

Portable Document Format (PDF) is a universal file format that preserves the fonts, images, and layout of source documents created on a wide range of applications and platforms. Adobe PDF is the standard for the secure, reliable distribution and exchange of electronic documents and forms around the world. Adobe PDF files are compact and complete, and can be shared, viewed, and printed by anyone with free Adobe Reader® software.

Adobe PDF is highly effective in print publishing workflows. By saving a composite of your artwork in Adobe PDF, you create a compact, reliable file that you or your service provider can view, edit, organize, and proof. Then, at the appropriate time in the workflow, your service provider can either output the Adobe PDF file directly, or process it using tools from various sources for such post-processing tasks as preflight checks, trapping, imposition, and color separation.

When you save in Adobe PDF, you can choose to create a PDF/X-compliant file. PDF/X (Portable Document Format Exchange) is a subset of Adobe PDF that eliminates many of the color, font, and trapping variables that lead to printing problems. PDF/X may be used wherever PDFs are exchanged as digital masters for print production—whether at the creation or output stage of the workflow, as long as the applications and output devices support PDF/X.

Adobe PDFs can solve the following problems associated with electronic documents:

Common problem	Adobe PDF solution
Recipients can't open files because they don't have the applications used to create the files.	Anyone, anywhere can open a PDF. All you need is the free Adobe Reader software.
Combined paper and electronic archives are difficult to search, take up space, and require the application in which a document was created.	PDFs are compact and fully searchable, and can be accessed at any time using Reader. Links make PDFs easy to navigate.
Documents appear incorrectly on handheld devices.	Tagged PDFs allow text to reflow for display on mobile platforms such as Palm OS®, Symbian™, and Pocket PC® devices.
Documents with complex formatting are not accessible to visually impaired readers.	Tagged PDFs contain information on content and structure, which makes them accessible on-screen readers.

Embedding and substituting fonts

InCopy embeds a font only if it contains a setting by the font vendor that permits it to be embedded. Embedding prevents font substitution when a reader views or prints the file, and ensures that readers see the text in its original font. Embedding increases the file size only slightly, unless the document uses CID (*multibyte*) fonts, a font format commonly used for Asian languages, where multiple characters are combined to create a single glyph.

PDF

For each font embedded, InCopy can embed the entire font or just a subset—the particular characters, called *glyphs*, used in the file. Subsetting ensures that your fonts and font metrics are used at print time by creating a custom font name. The subsetting options you choose affect disk space and your ability to do late-stage editing.

If InCopy cannot embed a font, it temporarily substitutes the font.

These typefaces can stretch or condense to fit, to ensure that line and page breaks are maintained from the original document. The substitution cannot always match the shape of the original characters, however, especially if the characters are unconventional ones, such as script typefaces.

**About compression**

When exporting to Adobe PDF, InCopy automatically downsamples images, crops image data to the image's frame, and compresses text and line art using the lossless ZIP method. ZIP works well on images with large areas of single colors or repeating patterns, and for black-and-white images that contain repeating patterns. Because InCopy uses the lossless ZIP method, data is not removed to reduce file size, so image quality is not affected.

Exporting to Adobe PDF

Export an InCopy document to Adobe PDF

You can export InCopy documents directly to Adobe PDF. You can export in the Galley, Story, or Layout view. If you export in Layout view, the result is a PDF document with layout and design elements intact. In contrast, a document exported in Galley or Story view resembles the text-only look that you see in Galley or Story view within InCopy. You might want to export the Galley or Story view of an InCopy story to PDF for writers, editors, and others in a document-review cycle who may not have InCopy on their computers. The PDF document has the same advantages that an InCopy Galley and Story view offers, including maximum text readability and annotation features.

***Note:** Adobe PDF files exported from Adobe InDesign® documents that contain overprints or transparency effects are best viewed in Acrobat 6.0 and later with the Overprint Preview option selected.*

- 1 Choose File > Export.
- 2 For Save As Type (Windows) or Format (macOS), choose Adobe PDF. Type a file name, choose a location for the file, and then click Save.
- 3 Select Galley & Story or Layout from the View menu.

PDF

4 Change settings as desired.

The settings you specify are saved with the application, and are applied to every new InCopy document you export to PDF until you choose new settings.

5 Click Export.

Note: When exporting to PDF, InCopy preserves links from Open Prepress Interface (OPI) comments for images in the InDesign document. OPI links let the InDesign user include fast, low-resolution versions (proxies) of images for positioning on a page. For final output, either InDesign or a prepress service provider can automatically replace the proxies with high-resolution versions.

Common Adobe PDF options

There are several options that are common to the Galley, Story, and Layout views when exporting a document to PDF.

Compatibility Sets the compatibility level of the Adobe PDF file. For documents that will be distributed widely, consider choosing Acrobat 5 (PDF 1.4) to ensure that all users can view and print the document. If you create files with Acrobat 8/9 (PDF 1.7) compatibility, the resulting PDF files may not be compatible with earlier versions of Acrobat.

Subset Fonts When Percent Of Characters Used Is Less Than Sets the threshold for embedding complete fonts based on how many of the fonts' characters are used in the document. If the percentage of characters used in the document for any given font is exceeded, then that specific font is completely embedded. Otherwise, the font is subsetted. Embedding complete fonts increases PDF file size, but if you want to make sure you completely embed all fonts, enter 0 (zero).

Include Page Information Includes the document name, page number, and date and time the file was exported.

View PDF After Exporting Opens the PDF file in the latest version of Acrobat currently installed on your computer. For accurate results, make sure that the compatibility option matches the latest version of Acrobat installed.

Adobe PDF options for Galley and Story views

The PDF Export dialog box contains options specific to Galley and Story views.

Stories Exports a single story or multiple stories.

Fonts Includes settings for font family and style, type size, and leading for the exported file. These settings do not change the screen view settings in the Galley & Story Display preferences.

Include Story Information The document title, author, and description appear in the exported PDF file.

Include Paragraph Styles Paragraph style information from the information column shown in Galley and Story views appears in the exported PDF file.

Include Inline Notes Exports all (or only visible) inline notes contained in the document. To include the note colors assigned to individuals on the project, select Show Notes Backgrounds In Color.

Include Tracked Changes Exports all (or only visible) tracked changes contained in the document. To include the editing colors assigned to individuals on the project, select Show Tracked Changes Backgrounds In Color.

Include Accurate Line Endings Exports line endings as they appear in the story. If unchecked, the lines of text wrap according to the width and orientation of the widest story window.

Include Line Numbers Exports with line numbers displayed in the information column. This option is available only if Include Accurate Line Endings is selected.

Fill Page (Use Multiple Columns) Exports the story using the number and width of columns you specify. This option is available only if Include Accurate Line Endings is selected.

Note: Selecting a small column width and a large font size (in the Fonts section of this section) can cause text to overlap in the exported output.

Adobe PDF options for Layout view

The following options are available only when exporting from Layout view:

All Exports all pages in the current document or book. This is the default setting.

Range Specifies the range of pages to export in the current document. You can type a range by using a hyphen, and separate multiple pages or ranges by using commas. This option is unavailable when you're exporting books.

Spreads Exports pages together as if they were bound, or printed on the same sheet.

Note: Do not select Spreads for commercial printing; if you do, the service provider cannot impose the pages.

Include Notes As Annotation Exports all notes as PDF annotations.

Interactive Elements Choose Include Appearance to include items such as buttons and movie posters in the PDF.

Optimize For Fast Web View Reduces PDF file size, and optimizes the PDF file for faster viewing in a web browser by restructuring the file for page-at-a-time downloading (byte serving).

Embed Page Thumbnails Creates thumbnail images within the exported PDF file.

Create secure PDF documents

You can restrict access to an Adobe PDF file when you export it. When files use security restrictions, any tools and menu items related to those features are dimmed.

You can secure a PDF file so that a user password is required to open it and a master password is required to change security settings. If you set any security restrictions in your file, you should also specify a master password; otherwise, anyone who opens the file could remove the restrictions. If a file is opened with a master password, the security restrictions are temporarily disabled. If the file has both passwords, you can open it with either one.

Note: The Compatibility setting determines the encryption level. The Acrobat 4 (PDF 1.3) option uses a low encryption level (40-bit RC4), while the other options use a high encryption level (128-bit RC4 or AES).

- 1 Choose File > Export.
- 2 For Save As Type (Windows) or Format (macOS), choose Adobe PDF. Specify a name and location for the file, and click Save.
- 3 Click Security Settings.
- 4 In the Passwords section, specify the password protection you want:
 - Select Password Required To Open Document and, in the Document Open Password text box, enter the password users must enter before they can open the PDF file.
 - Select Password Required To Change Permissions And Passwords and, in the Permissions Password text box, enter the password users must enter before they can set or change any security options in the PDF file.

Note: You cannot use the same password in both text boxes.

5 In the Permissions section, define the level of user actions allowed:

No Printing Prevents users from printing the Adobe PDF file.

No Changing The Document Prevents users from filling in forms or making any other changes to the Adobe PDF file.

No Content Copying Or Extraction, Disable Accessibility Prevents users from selecting text and graphics.

No Adding Or Changing Comments And Form Fields Prevents users from adding or changing notes and form fields if they open the PDF file in Adobe Acrobat or another PDF editor.

6 Click Save, and then click Export.

Chapter 11: XML

Working with XML

Adobe InDesign is one of many applications that can produce and use XML. After you tag content in an InDesign file, you save and export the file as XML so that it can be repurposed in another InDesign file or another application. Similarly, you can import an XML file into InDesign and instruct InDesign to display and format the XML data any way you want.

About XML

XML (Extensible Markup Language) is a way to repurpose data in a file or automate the process of replacing the data in one file with data from another file. XML employs tags to describe parts of a file—a heading or a story, for example. These tags mark data so it can be stored in an XML file and handled appropriately when it is exported to other files. Think of XML as a translation mechanism for data. XML tags label text and other content in a file so that applications can recognize and present the data.

Extensible language

XML is considered an *extensible* language because individuals create their own XML tags—they can create one tag for each type of information that they want to repurpose. XML tags don't carry information about how data is supposed to be displayed or formatted. XML tags are strictly for identifying content.

In InCopy, for example, you can create a Heading1 tag and assign it to each first-level heading in a document. After you save the document as an XML file, the Heading1 content can be imported and put to use—by any application that can read XML—as a web page, printed catalog, directory, price list, or database table.

InDesign is one of many applications that can produce and use XML. After you tag content in an InDesign file, you save and export the file as XML so that it can be repurposed in another InDesign file or another application. Similarly, you can import an XML file into InDesign and instruct InDesign to display and format the XML data any way you want.

Adobe InCopy is one of many applications that can produce and use XML. After you tag content in an InCopy file, you save and export the file as XML so that it can be repurposed in another InCopy file, InDesign file, or another application.

In InCopy, you can create XML tags and tag parts of a document even if you're not experienced with XML. InCopy handles XML programming behind the scenes and creates the XML for you when you export a document in XML format.

Note: Do not confuse XML tags with InCopy tagged text.

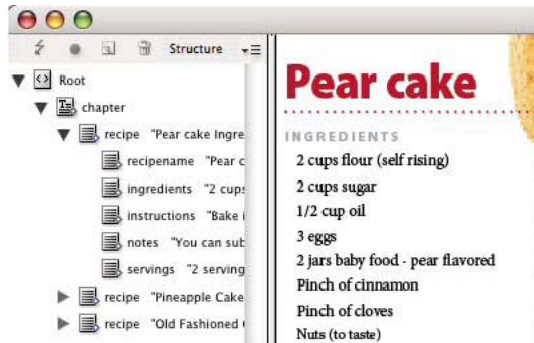

XML data structure

The *element* is the building block of XML data; an element is data that has been tagged. In XML files, elements are nested within other elements to create a hierarchical structure for the data.

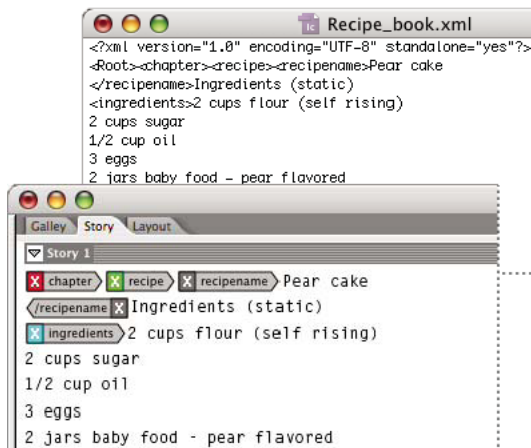

XML

You can see the structure of XML data in the Structure pane, which displays the hierarchy and sequence of elements. In the XML structure, child elements are contained by parent elements, which in turn may also be child elements. Or, seen from the other direction, parent elements contain child elements, and these child elements may in turn be parent elements to other child elements.

For example, in the following image, you can see a chapter element that contains (is the parent of) several recipe elements. Each recipe element, in turn, is the parent of elements called recipename, ingredients, instructions, notes, and servings. All elements are contained inside the Root element, which appears at the top of the Structure pane.

For example, in the following image, you can see a chapter element that contains (is the parent of) a recipe element. The recipe element, in turn, is the parent of elements called recipename and ingredients. All elements are contained inside the Story element, which always appears at the top of the Structure pane.

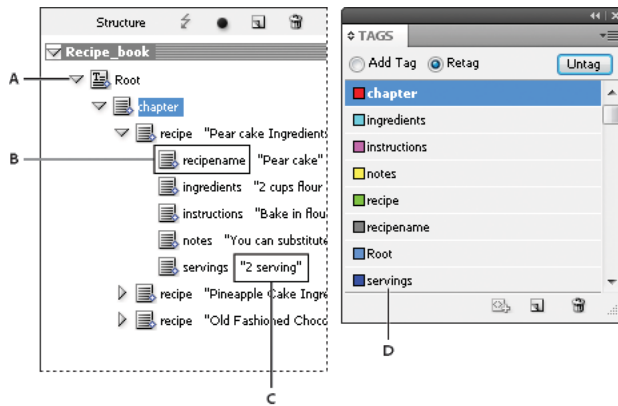

XML tools

InCopy provides the Structure pane and the Tags panel for working with XML content. The Structure pane displays all the elements in the document and their hierarchical structure. To help you identify each element, InCopy displays its element tag and an icon that indicates what type of content it holds. In addition, the Structure pane can display the first few words of text in an element, called a *text snippet*, which is not to be confused with snippet files that store objects for reuse.

XML

A Triangle to expand or collapse elements B Element (placed in layout) C Element (not in layout) D Text snippet E Element tag

A Triangle to expand or collapse elements B Element placed in layout C Text snippet D Element tag

The Structure pane lets you view, edit, and manage XML elements. You use the Structure pane in many ways when working with XML. For example, to place imported XML content into the layout, you can drag elements from the Structure pane directly to a page. You also use the Structure pane to adjust the hierarchy of the elements. You can add elements, attributes, comments, and processing instructions by way of the Structure pane.

The Tags panel lists tags for elements. You can import, export, add, delete, and rename tags. You use the Tags panel to apply element tags to content that you plan to export to XML, and to apply tags to frames before importing XML content into them.

The Tags panel lists tags for elements. You can import, export, add, delete, and rename tags. You use the Tags panel to apply element tags to content that you plan to export to XML.

About DTD files

To share XML data with others, you need to agree on a standard set of tag names and element attributes so that everyone in your group uses and applies tags the same way. One method for handling the sharing of XML data is to use a document type definition (DTD) file.

A DTD file provides a set of elements and attributes for members of the group to use. It also defines the rules about where elements can appear in the structural hierarchy. For example, the DTD file may require the Title element to be a child of the Story element because the title is supposed to appear inside the story; if you tag a title without tagging the story it appears in, the DTD file marks the Title element as invalid. You can search for and flag invalid structural errors in an InDesign file with a DTD file. This process is called *validating*.

XML

To use a DTD file (if your document doesn't already contain one), you load it into your document. This imports the element names from the DTD into the Tags panel. Others who have loaded the same DTD file have the same element names, which ensures that everyone in the group uses the same elements. The imported elements are locked, which means they can't be deleted or renamed unless the DTD file is deleted from the document.

Although you cannot import a DTD file into InCopy, DTD files you import in InDesign are available when you edit the story in InCopy. You can view the DTD file in InCopy and validate stories against it to ensure that tags have been applied correctly.

```

View DTD

DOCTYPE: MyPub
DTD:
<!-- MyPub: Highest level (root) element of the entire pub -->
<ELEMENT MyPub (Header, Body, Graphic)*>
<!ATTLIST MyPub
  Purpose (Demo | Test) #REQUIRED
  Revision CDATA #REQUIRED
>
<!-- Header: Contains the Title and "GuyInGlasses" graphic -->
<ELEMENT Header (Title, Graphic)*>
<!-- Title: Container for "Star Flight" text-->
<ELEMENT Title (#PCDATA)*>
<!-- Body: Container for main context of pub -->
<ELEMENT Body (Text|Box | Blur| MoreInfo)+>
<!-- Text|Box: Container for all text content -->

```

 You may find that a DTD file created by a group or industry similar to yours includes tags and structures that meet your needs. For a current list of registered DTDs, visit www.xml.com/pub/rg/DTD_Repositories (English only).

XML rule sets

XML rule sets are sets of instructions written in a scripting language (such as JavaScript or AppleScript) that evaluate XML data and take certain actions if that data meets certain conditions. Each rule consists of at least one condition and at least one action. A rule evaluates the XML data against the conditions, and if a condition is met, then it takes the appropriate action. For example, an XML rule can specify that whenever the Paragraph element appears under the Subhead element (a condition), a specific style (an action) is applied; or that whenever the Product element (a condition) appears, a new frame is created and a product image is imported (actions). XML rules are a means of dynamically creating and formatting layouts based on XML.

Preparing XML files for K4 or InCopy workflows

To prepare files with XML tagging for use within the K4 or InDesign/InCopy workflow environments, you may need to adjust how you prepare the structure and import XML into InDesign files.

There are two methods for importing XML into InDesign: merge and append. Merge can replace the existing structure, whereas append adds to any existing structure. In both cases, it is important that the root element is not associated with a text frame. Either use the default element named "Root" or rename this element based on your current workflow or requirement as needed, again being sure that it is not associated with a text frame.

Using XML files

Open an XML file in InCopy

You can open any existing XML file in InCopy for editing and tagging.

Note: You can import Ruby used in XML files when the Ruby is compliant with the W3C standard Ruby definition and uses the InDesign namespaces. InDesign uses the following namespaces.

`xmlns:aid="http://ns.adobe.com/AdobeInDesign/3.0/_ver3.0"`

- 1 Choose File > Open.
- 2 Locate and select the XML file you want to use.
- 3 Click Open.

Save an XML file as an InCopy story

You can save XML files as InCopy stories.

- 1 Open the XML file in InCopy.
- 2 Choose File > Save Content As.
- 3 Type the name and specify the location for the file.
- 4 From the Save As Type menu (Windows) or Save As menu (macOS), choose InCopy Document, and click Save.

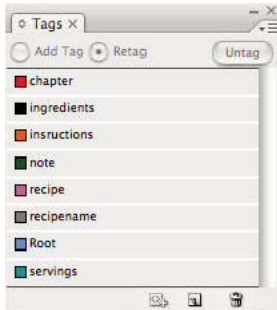

Tagging content for XML

Create and load XML tags

Before you tag page items, create (or load) tags to identify each content type or item in your document. You can create tags from scratch or load them from another source, such as an InDesign document, InCopy document, or DTD file. Use any of the following methods to create or load XML tags for your document:

- Create a tag with the New Tag command.
- Load tags from an XML file or another document.
- Import a DTD file.
- Import tags (and content) using the Import XML command.

XML

Create an XML tag

- 1 Choose Window > Utilities > Tags to open the Tags panel.
- 2 Do one of the following:
 - Choose New Tag from the Tags panel menu.
 - Click the New Tag button  on the Tags panel.
- 3 Type a name for the tag. The name must conform to XML standards. If you include a space or an illegal character in the tag name, an alert message appears.
- 4 Select a color for the tag if you created your tag from the Tags panel menu. (If you created your tag with the New Tag button, you can choose a color by changing the color of the tag.)

Note: You can assign the same color to different tags. The color you select appears when you apply the tag to a frame and choose View > Structure > Show Tagged Frames, or when you apply the tag to text within a frame and choose View > Structure > Show Tag Markers. (Tag colors do not appear in exported XML files.)

- 5 Click OK.

Load XML tags from another source

You can load tags from an XML file, an InDesign document, or an InCopy document.

Note: InCopy automatically adds tags to the Tags panel when you load an XML file.

- 1 Choose Load Tags from the Tags panel menu.
- 2 Select the file containing the tags you want to load into the Tags panel, and then click Open.

Change tag name or color

- 1 Double-click a tag name in the Tags panel or choose Tag Options in the Tags panel menu.
- 2 Change the name or the color of the tag, and click OK.

Note: You cannot change the name of locked tags. InCopy automatically locks tags specified in a loaded DTD file. To change the name of these tags, you must edit the DTD file and reload it into the document.

Tagging items

Before you export content to an XML file, you must tag the text and other items (such as frames and tables) that you want to export. You also need to tag items that you have created as placeholders for imported XML content. Items that have been tagged appear as elements in the Structure pane.

XML

A Elements appear in the Structure pane. B Tag markers surround text to which tags have been applied.

When tagging page items, note the following:

- Text frames must be tagged before you can tag the text inside them.
- You can apply only one tag to a frame.
- Threaded text frames share a single tag, which applies to all text in the thread, including overset text.
- When you tag text within a tagged element (for example, when you tag a paragraph within a tagged story), the text appears as a child element of an existing element in the Structure pane.
- When you tag an element within a frame with the Autotag button, InCopy automatically tags the frame using the tag specified in the Tagging Preset Options dialog box.

Tag text within a text frame

- 1 Choose View > Layout View.
- 2 Make sure that the text frame in which the text appears is tagged. (If the frame isn't tagged when you try to tag text within the frame, InCopy tags the story using default tags.)
- 3 Do one of the following:
 - Using the Type tool  select text within a text frame, and then click a tag in the Tags panel. If you select all of the text within the frame, the tag is applied to the frame, not to the block of text (unless you've selected Add Tag in the Tags panel).
 - Select the text frame, table, table cells, or image that you want to tag, and click the Autotag icon in the Tags panel to apply a default tag.
 - Automatically tag text to which styles have been applied using the Map Styles To Tags command.

Tag text in tables

When you tag a table for export to XML, you create a table element as well as one cell element for each cell in the table. The cell elements are child elements of the table element and are created automatically.

- 1 Choose View > Layout View.
- 2 Click in the table and choose Table > Select > Table.
- 3 Select a tag for the table in the Tags panel.

InCopy creates a cell element for each cell in the table (you can display them in the Structure pane). The tag applied to table cell elements depends on your tagging present options.

- 4 If needed, tag table cells with a different tag.

XML

For example, you can tag the first-row cells with a different tag to identify them as heading cells. To apply tags to cells, select the actual table cells in your document, and then select a tag. (Selecting cells in the table also selects the corresponding cell elements in the Structure pane.)

 You can also tag a table by selecting it and then clicking the Autotag icon in the Tags panel. The Table tag (or another tag of your choice) is applied immediately to the table, according to your Autotag default settings.

Tag content according to styles

Paragraph, character, table, and cells styles you assign to text can be used as a means of tagging text for XML. For example, a paragraph style called Body can be associated with a tag called StoryText. Then, using the Map Styles To Tags command, you can apply the StoryText tag to all paragraphs in your document that are assigned the Body paragraph style. You can map more than one style to the same tag.

Note: The Map Styles To Tags command tags content automatically, including paragraphs and characters that have been tagged already. To retain existing tags, apply tags manually.

- 1 Choose Map Styles To Tags from the Tags panel menu or Structure pane menu.
- 2 For each style in your document, specify the tag that you want it to be mapped to.

- 3 To match style names to tag names, click Map By Name. Styles that are named identically to tag names are selected in the dialog box. Map By Name is case-sensitive; Head1 and head1, for example, are treated as different tags.
- 4 To use style mappings set up in an InDesign file, click Load and select the file.
- 5 Select or deselect Include options:
 - Master Pages Stories** Maps styles found on the master page to tags.
 - Pasteboard Stories** Maps styles found on stories on the pasteboard to tags. (Deselect this option to keep stories on the pasteboard from being tagged.)
 - Empty Stories** Maps styles located in empty stories to tags. (Deselect this option to keep styles on empty stories from being tagged.)
- 6 Click OK.

The new XML tags are applied throughout your document to paragraph, character, table, and cell styles that you specified in the Map Styles To Tags dialog box.

Untag a page item

Untag an item to remove its tag but retain the associated content.

- 1 Select the element in the Structure pane window, or select the page item in the document layout.
- 2 Do one of the following:
 - Click Untag Element in the Structure pane menu.
 - Click the Untag button in the Tags panel.

Retag a page item

Retag an item to replace the existing tag (you don't need to untag it first).

- 1 Select the Type tool .
- 2 Do one of the following:
 - Select the text or text frame, and then click a different tag in the Tags panel.
 - Place the insertion point in a tagged text frame within a story element (not a child element). Select Retag at the top of the Tags panel, and click a different tag in the Tags panel.
 - Select the entire block of text to which a tag has been applied, select Retag at the top of the Tags panel, and click a different tag. (If you select Add Tag at the top of the Tags panel, and then click a different tag, a new child element will appear in the Structure pane.)

Specify Autotag defaults

When you select a text frame, table, table cells, or an image, and then click the Autotag icon in the Tags panel, InDesign applies a default tag to the item you selected. You can specify these default tags in the Tagging Preset Options dialog box.

When you select a text frame, table, table cells, or an image, and then click the Autotag icon in the Tags panel, InCopy applies a default tag to the item you selected. You can specify these default tags in the Tagging Preset Options dialog box.

Note: *InCopy applies a default tag when you create an element that requires a parent element, but doesn't yet have one. For example, if you tag text within a text frame but the frame itself isn't tagged, InCopy assigns the frame a tag according to the Tagging Preset Options. The capability to apply default tags helps InCopy maintain correct XML structure.*

- 1 Choose Tagging Preset Options from the Tags panel menu.
- 2 Choose a default tag for text frames, tables, table cells, and images.

 *If the tag you need isn't listed, you can choose New Tag from the menu and create a tag.*

Map XML tags to styles

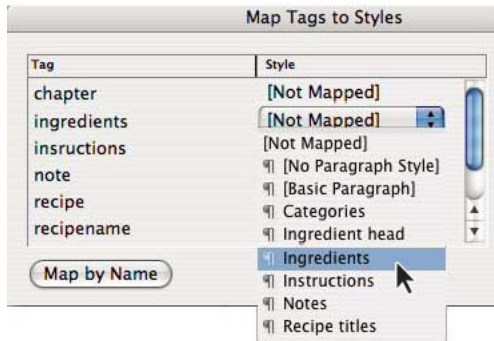

XML tags are merely data descriptions; they carry no formatting instructions. As such, you need to format XML content after you import it and lay it out. One way to do that is to map XML tags to paragraph, character, table, or cell styles. For example, the Byline tag could be mapped to the Author character style, so that all imported and placed XML content that is tagged Byline is automatically assigned the Author character style. Mapping tags to styles makes formatting imported XML content easier and less time-consuming.

You don't need to map every tag to a paragraph or character style. Some elements may not appear in the layout and others may be easier to format one at a time. Moreover, child elements take on the paragraph or character style that is assigned to their parent, which can cause confusion unless you are careful to map parent and child elements separately.

XML

Note: The *Map Tags To Styles* command reapplies styles throughout a document, sometimes with unwanted results. When you map a tag to a style, text that was previously assigned to one style may be reassigned to another, depending on its XML tag. If you've already formatted some text, you might prefer to apply styles manually to prevent your paragraph and character style choices from being overridden.

- 1 Choose *Map Tags To Styles* from the Tags panel menu or the Structure pane menu.

- 2 Do any of the following:

- To import styles, tags, and mapping definitions from another document, click *Load*, choose a document, and click *Open*.
- To map tags to styles individually, click the *Style* column adjacent to a tag, and choose a paragraph or character style from the menu that appears. (The paragraph symbol identifies paragraph styles in the menu; an “A” identifies character styles.) Repeat for each tag you want to map.
- To automatically map tags to styles with the same names, click *Map By Name*. Styles with names that are identical to tag names are selected in the *Style* column. To match, a tag and style must not only have the same name, but the same case; H1 and h1, for example, are not considered a match. (If the same style name exists in two different style groups, *Map By Name* doesn't work and you are alerted to rename one of the styles.)

- 3 Click *OK*.

Show or hide tagged frames or tag markers

In *Galley* and *Story* views, *tag markers* indicate where items on a page have been tagged. In *Layout* view, *tagged frames* indicate where items such as tables and images have been tagged. The tag color determines the color of the marker or frame.

Do any of the following:

- To display tagged frames in color, choose View > Structure > Show Tagged Frames.
- To hide the color-coding of tagged frames, choose View > Structure > Hide Tagged Frames.
- To display color brackets around tagged text, choose View > Structure > Show Tag Markers.
- To hide color brackets around tagged text, choose View > Structure > Hide Tag Markers.

Delete tags or elements

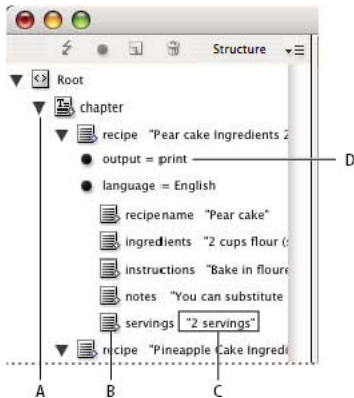

- To delete a tag from the Tags panel, drag it to the Delete Tag icon  at the bottom of the panel. If the tag has been applied to content, an alert message appears. Select another tag to replace the deleted tag, and then click OK.
- To delete all unused tags, choose Select All Unused Tags from the Tags panel menu, and click the Delete Tag icon at the bottom of the panel.
- To delete an element from the Structure pane, select the element, and then click the Structure pane Delete icon or choose Delete from the Structure pane menu. If the element contains any content, an alert message appears. Click Untag to leave the content in the document; click Delete to delete both the element and its content.

Note: Tags that were loaded with an imported DTD file cannot be deleted until the DTD file is deleted.

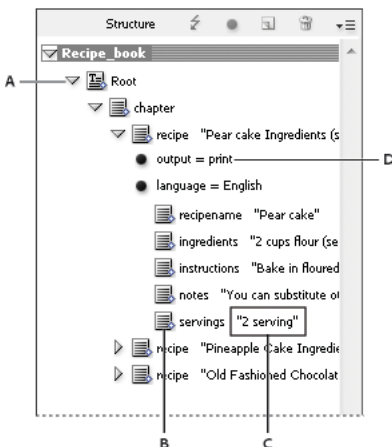

Structuring documents for XML

Structure pane overview

The Structure pane displays, in hierarchical form, items in a document that have been marked with XML tags. These items are called *elements*. You can move elements in the Structure pane to define the order and hierarchy of items. An element consists of an icon indicating the element type and a tag name.

A Triangle to expand or collapse elements B Element C Text snippet D Attribute

A Triangle to expand or collapse elements B Element C Text snippet D Attribute

Additionally, elements may provide this information:

Blue diamond A blue diamond on an element icon means that the element is attached to an item on the page; the absence of a blue diamond means that the element has not been attached to a page item.

Underline The tag name is underlined if the item on the page to which the element corresponds is selected. For example, if you select text to which you assigned the *Title* tag, the word *Title* in the text's element is underlined in the Structure pane. Underlining shows you selected items on the page and elements in the Structure pane correspond.

Text snippet The first 32 characters of tagged text, called a *text snippet*, can appear to the right of the element. These snippets help you identify the page item to which an element corresponds.

Dot and attribute Attributes provide metadata information about an element. If attributes are attached to an element, a black dot along with attribute names and values appear below the element.

Use the Structure pane

- To open the Structure pane, choose View > Structure > Show Structure.
- To close the Structure pane, choose View > Structure > Hide Structure, or click the splitter button.
- To expand or collapse an element (and display or hide any of its child elements), click the triangle next to the element.
- To adjust the size of the Structure pane, drag the splitter button.
- To expand or contract an element as well as all elements contained within it, hold down Ctrl (Windows) or Command (macOS) while clicking the triangle next to the element.
- To show or hide text snippets, choose Show Text Snippets or Hide Text Snippets from the Structure pane menu.

Structure pane icons

The following icons appear in the Structure pane:

Icon	Name	Use
	Root element	Each document includes one root element at the top, which can be renamed but cannot be moved or deleted.
	Story element	Represents tagged stories (one or more linked frames).
	Text element	Represents tagged text within a frame.
	Graphic element	Represents a tagged frame that includes a placed image. Each graphic element includes an href attribute that defines the path or URL to the linked file.
	Unplaced text element	Unplaced text element not yet associated with a page item.
	Unplaced graphic element	Unplaced graphic element not yet associated with a page item.
	Table element	Represents a table.
	Header cell element	Represents a cell in the header row of a table.
	Body cell element	Represents a cell within the body of a table.
	Footer cell element	Represents a cell in the footer row of a table.
	Empty element	An empty frame is associated with this element.
	Attribute	Includes metadata, such as keywords or location of a linked image (HREF attribute).

Icon	Name	Use
	Comment	Includes comments that appear in the XML file, but not the InDesign document.
	Processing instruction	Includes an instruction that triggers an action in applications that can read processing instructions.
	DOCTYPE element	Tells InDesign which DTD file to use when validating the XML file.

Rearrange structured elements

You can change the order and hierarchical rank of elements in the Structure pane. However, observe these rules:

- An XML document is required to have a single root element at the top of the structure. The root element contains and is the parent to all other elements. Only the DTD (appearing as a DOCTYPE element), comments, and processing instructions may appear above the root element in the Structure pane.
- Changes to the XML hierarchy structure may affect the appearance of tagged items on InCopy pages. For example, making a text element the child of an element elsewhere in the structure also moves the text in the layout.
- You cannot drag a table cell element into a table element or move elements into a table element.

In the Structure pane, do one of the following:

- To move an element, drag it to a new location within the structure. A line appears when you drag to indicate where you are inserting the element. The width of the line marks the level within the hierarchy.
- To make an element a child of another element, either position it over the parent element to highlight it or place it amongst the parent's other child elements, and then release the mouse button.
- To demote an element by one level in the hierarchy, drag it just above another parent element and move it to the left slightly until the line indicating its placement spans the width of the parent element.
- To copy or cut an element, select the element or elements in the Structure pane, and then choose Edit > Copy or Edit > Cut. Select the element directly above where you want to insert the element, and choose Edit > Paste.

Note: When you cut an element, the element and contents are cut to the clipboard, but the frame remains intact.

Insert a parent element

Insert a parent element in the Structure pane to maintain the proper XML structure or organize content better. Before you can insert a new parent element, you must select the elements that will be the children of the new parent. When the new parent element is inserted, the selected child elements are demoted by one rank in the structural hierarchy.

XML

- 1 In the Structure pane, select the elements that will be child elements to the new parent element you want to insert. Note the following:
 - You can't select the Root or a root-level element.
 - You can't select the Story or a story-level element.
 - The elements must be on the same level of the structural hierarchy.
 - The elements must be contiguous.
 - The selection must not include table cells or attributes.
- 2 On the Structure pane menu, choose New Parent Element, or right-click (Windows) or Control-click (macOS) and choose New Parent Element.
- 3 Select a tag for the new parent element and click OK.

 *Insert a new parent element quickly by selecting Add Tag in the Tags panel and then clicking a tag in the panel. You can also right-click (Windows) or Control-click (macOS) an element you selected in the Structure pane, choose New Parent Element, and then choose an element.*

Work with attributes

An *attribute* provides additional information about an XML element. Each attribute consists of a name and a value. Attributes appear in the Structure pane; they are not placed in the document or used as content in the document. Include attributes with elements for the benefit of files and applications that will use the XML files you create in InCopy.

When you tag an image, InDesign automatically creates an *href* attribute with a value that defines the on-disk location of the image file. This *href* attribute allows other files and applications to locate the image on disk so it can be displayed.

You can add attributes to any element except the DOCTYPE element (a DTD file), comments, and processing instructions. For example, to include keywords for searching in a downstream application, you can create an attribute called *keywords*. You could also create attributes to indicate substituted text, track article titles, and record other content-related information.

XML

 If you are using a DTD file, view its contents to see which attributes it allows. Attribute names, like tag names, must conform to the DTD.

Note: InCopy recognizes special namespace attributes that can specify paragraph or character styles, tables and table cell styles, as well as control whitespace.

Add an attribute

- 1 Select an element.
- 2 Do one of the following:
 - Click the Add An Attribute button .
 - Choose New Attribute on the Structure pane menu.
 - Right-click (Windows) or Control-click (macOS) the selected element and choose New Attribute.
- 3 Specify a name and a value for the attribute, and then click OK.

Show or hide attributes in the Structure pane

Choose Show Attributes or Hide Attributes from the Structure pane menu.

You may need to click the triangle icon next to an element to display its attributes.

Edit or delete an attribute

- 1 Select an attribute in the Structure pane.
- 2 Do one of the following:
 - To edit the attribute, double-click it or choose Edit from the Structure pane menu.
 - To delete the attribute, click the Delete icon or choose Delete from the Structure pane menu.

Edit href attributes

InCopy creates href attributes automatically to handle image files. The href attribute defines the on-disk location of the image file so that the image file can be displayed. When you tag a placed image, InCopy creates an href attribute value that lists the image's path and filename.

The path can be an absolute link, a relative link to the same folder as the XML file, or a relative link to the Images subfolder of the folder where the XML file is located. Relative paths are specific to the path where the document is saved.

- An href attribute with an absolute link looks like the following (in Windows and the macOS):

```
href=file:///C:/Images/Meadow.psd
```

```
href=file:///Users/abhayc/Desktop/abc.jpg
```

- An href attribute to an image file in the same folder as the XML file looks like the following:

```
href=file:Meadow.psd
```

- An href attribute to an image file in the Images subfolder looks like the following:

```
href=file:///Images/Meadow.psd
```

XML

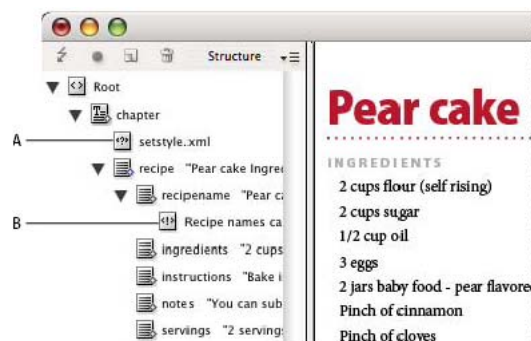

You can edit the href attribute to specify a new link to an image. For example, you can edit an absolute link to make it a relative link, thereby making the image file accessible when you export the file.

- 1 In the Structure pane, double-click the href attribute. (You may need to click the triangle icon next to the image element to display the attribute.)
- 2 For Value, enter the new path to the image, and then click OK.

Add comments and processing instructions

Using InCopy, you can include comments and processing instructions in an XML file. Enter a comment to include descriptive information about an element. Comments can be viewed in web browsers and text editors. They help others understand XML structure and XML tags. A processing instruction is a special, application-specific command. For example, you can enter a page-break processing instruction so that an application to which you export your XML file understands where to enter a page break. InCopy user-created processing instructions are meant for use in other programs; InCopy itself does not act on processing instructions.

Comments and processing instructions appear in the Structure pane. You can move, edit, and delete comments and processing instructions as you can other elements in the Structure pane. They cannot, however, contain child elements or attributes.

A Processing instruction B Comment

Add a comment

- 1 Select the element about which you will comment.

Note: To add a comment to a table, select a table cell element. You can add comments to table cells, not tables.

- 2 Choose New Comment in the Structure pane menu.
- 3 Type the comment in the New Comment dialog box.

Add a processing instruction

- 1 Select an element for the processing instruction.

Note: To add a processing instruction to a table, select a table cell element. You can add processing instructions to table cells, not tables.

- 2 Choose New Processing Instruction in the Structure pane menu.
- 3 For Target, enter a name that identifies the processing instruction to an application that reads exported XML files.
- 4 For Data, enter a value that tells the application what to do with the processing instruction.

View comments and processing instructions

Choose Show Comments or Show Processing Instructions in the Structure pane menu.

Edit comments and processing instructions

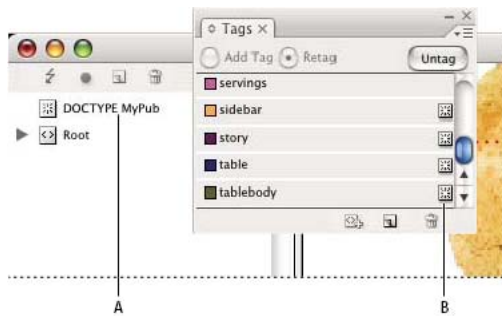

- 1 Select the comment or processing instruction.
- 2 Do any of the following:
 - Double-click the comment or processing instruction.
 - Choose Edit on the Structure pane menu.
- 3 Edit the comment or processing instruction and click OK.

Use DTD files to validate XML

Validating the XML in a document means to compare the structure, element tag names, and attributes against the specifications of a DTD file. To validate against a DTD file, you must first load it into your document in InDesign.

Note: Loading a DTD file imports tag names into the Tags panel. These imported tag names are locked; they can't be deleted or renamed except by deleting the DTD file from the document.

The DOCTYPE element appears at the top of the Structure pane if a DTD file has been loaded into your document. (DTDs are sometimes loaded automatically when you import an XML file.) To replace the DTD file in a document, delete the existing DTD and then load a new one.

A DOCTYPE element from the DTD file (Structure pane) B Locked tag from the DTD file (Tags panel)

Load a DTD file

When you load a DTD file, InDesign embeds the file in the document.

- 1 Do one of the following:
 - In the Structure pane, choose Load DTD from the Structure pane menu.
 - In the Tags panel, choose Load DTD from the panel menu.
- 2 Select a DTD file to import, and click Open.

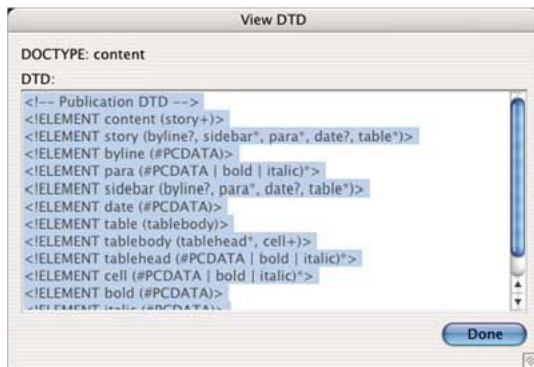

To view tags defined in the DTD file, open the Tags panel by choosing Window > Utilities > Tags.

View a DTD file

DTDs are written in ASCII text. They may contain embedded instructions and explanations that describe how to apply tags and order elements correctly. In InDesign, you can only view a DTD that is loaded in a document.

XML

Do one of the following:

- In the Structure pane menu, choose View DTD.
- Double-click the DOCTYPE element in the Structure pane.

To print a DTD file, copy code from the View DTD window and paste it in a text editor.

Delete a DTD file

Choose Delete DTD from the Structure pane menu.

InDesign deletes the copy of the DTD file stored in the InDesign document, not the original DTD file. Tags that were imported with the DTD file remain in the Tags panel but are unlocked.

Validate XML structure

When you validate your document, InCopy alerts you if the XML deviates from rules established by the DTD file. It suggests ways to make the XML meet DTD file requirements. You can fix errors one at a time or view all errors in a separate window.

A Loaded DTD B Error or invalidating condition C Description of error with suggested fix D Error count E Validate button F View all errors in a separate window

XML

A DOCTYPE element from assigned DTD file B Error or invalidating condition C Description of error with suggested fixes D Error count E Validate button F View all errors at once in a separate window

- 1 Choose View > Structure > Show Structure.
- 2 In the Structure pane, click the Validate button .

 To change the root element from which InDesign validates, choose DTD Options in the Structure pane menu.

- 3 To fix errors displayed in the Suggestion pane, either click a suggested fix to try it, or edit the XML structure and tags directly using the Structure pane and the Tags panel.
- 4 To view other errors, do one of the following:
 - Click the Left arrow  or Right arrow .
 - Click the Error Window button  to view all errors in a separate window.
 - Choose View List Of Errors on the Structure pane menu.

Note: InCopy stops validating after detecting 250 errors. A plus sign in the Error Count box appears when this limit is reached.

Exporting to XML

Exporting to XML

Export an InCopy file to XML

Before you can convert InCopy stories to XML data, you must have done the following:

- Created or loaded element tags.
- Applied tags to items in stories.
- Rearranged elements in the Structure pane, if needed.

You can export all or a portion of the XML content in your document. Only content that is tagged can be exported.

- 1 If you intend to export only a portion of the document, select the element in the Structure pane where you want exporting to begin.
- 2 Choose File > Export.
- 3 Choose XML for Save As Type (Windows) or Format (macOS).
- 4 Type the name and specify the location of the XML file, and then click Save.
- 5 In the Export XML dialog box, select the desired encoding scheme: UTF-8 or UTF-16.
- 6 Do any of the following:

Include DTD Declaration Exports the loaded DTD file along with the XML file. This option is only available if you loaded a DTD file in your document.

View XML Using Opens the exported file in a browser, XML-editing application, or text editor. Choose the browser or application from the list.

Export From Selected Element Starts exporting from the element you selected in the Structure pane. This option is only available if you selected an element before choosing File > Export.

Export Untagged Tables AS CASL XML Exports any untagged tables in CASL XML format.

Remap Break, Whitespace, And Special Characters Exports break, whitespace, and special characters as decimal character entities rather than straight characters.

Apply XSLT Applies a stylesheet to define the transformation of the exported XML to HTML or another format. Select Browse (Windows) or Choose (macOS) to select an XSLT from the file system.

- 7 Click Export to export the XML file.

Export tags only

- 1 Choose Save Tags from the Tags panel menu.
- 2 Type a name and specify a location for the file.
- 3 For Encoding, select UTF-8, UTF-16, or Shift-JIS (for Japanese characters), and then click Save. InCopy saves the tags as an XML file.

Chapter 12: Keyboard shortcuts

Default keyboard shortcuts

Adobe InCopy provides shortcuts to help you quickly work in documents. Many keyboard shortcuts appear next to the command names in menus. You can use the default InCopy shortcut set, a Microsoft Word shortcut set, or a shortcut set that you create.

 You can generate a list of the current keyboard set by choosing Show Set in the Keyboard Shortcuts dialog box. This option is especially useful for printing a copy of your custom shortcuts.

Keys for tools

This table isn't a complete list of keyboard shortcuts. It lists only those shortcuts that aren't displayed in menu commands or tool tips.

Result	Windows®	macOS
Switch between Text tool and Note tool	Shift+Esc	Shift+Esc
Temporarily switch from Text tool to Note Tool	Alt+Shift	Option+Shift
Temporarily switch to Hand tool (Layout view)	Alt+spacebar	Option+spacebar
Temporarily switch to Zoom tool (Layout view)	Ctrl+spacebar	Command+spacebar
Temporarily switch to Zoom In tool (Layout view)	Ctrl+spacebar	Command+spacebar
Temporarily switch to Zoom Out tool (Layout view)	Ctrl+Alt+spacebar	Command+Option+spacebar

Keys for navigating through documents

This table isn't a complete list of keyboard shortcuts. It lists only those shortcuts that aren't displayed in menu commands or tool tips.

Result	Windows	macOS
Go to first/last page (Layout view)	Ctrl+Shift+Page Up/ Page Down	Command+Shift+Page Up/Page Down
Go to previous/next page (Layout view)	Shift+Page Up/Page Down	Shift+Page Up/Page Down
Move right/left one character	Right Arrow/Left Arrow	Right Arrow/Left Arrow
Move up/down one line	Up Arrow/Down Arrow	Up Arrow/Down Arrow
Move right/left one word	Ctrl+Right Arrow/Left Arrow	Command+Right Arrow/ Left Arrow
Go to beginning of sentence forward/backward (Galley and Story views)	Ctrl+]/[Command+]/[
